## **ACKNOWLEDGEMENTS & COMPLIANCE STATEMENT**

My thanks to the family, particularly my parents and siblings, and friends who supported me through the long process of completion of this dissertation. Thanks are also due to my patient advisor, Professor Josh Dehlinger, and the other members of the committee, Professors Chakraborty, Hammell, and Song.

I am also grateful to the dedicated faculty and staff at both the United States Naval Academy and Loyola University Maryland, as well as my students at both institutions who graciously ignored the large piles on my desk that were clearly not class related.

This entire effort and I am also in debt to the faculty, staff, and students of Towson University and the Department of Computer and Information Sciences generally, and most especially everyone at the Albert S. Cook Library, whose time, helpfulness, and cooperation was simply astounding.

The studies conducted for this effort were conducted under exemption number 11-0X14, issued by the Towson University Institutional Review Board for the Protection of Human Subjects. Additional information regarding this exemption is located in the appendices.

## **ABSTRACT**

### **REQUIREMENTS ELICITATION AND QUALITATIVE ANALYSIS FOR STRATEGIC AND CONTEXTUAL CAPTURE FOR ENTERPRISE ARCHITECTURES USING A CASE STUDY APPROACH**

Nicholas Stephen Rosasco

Enterprise architectures (EAs) aim to develop a tight alignment between an enterprise's environment and its business objectives. To facilitate this, enterprise architecture frameworks (EAFs) have been used to understand both strategy and business architecture to synthesize a supporting information system (IS). This acquired understanding of the background that shapes the functions and goals of an enterprise is then used to drive decision making at the strategic, tactical, and operational levels. Problematically, a formidable barrier – the acquisition of expertise in EA – exists for any enterprise looking to use one of the common EAFs. By guiding the initial data gathering necessary for an EA with the application of a lightweight elicitation mechanism, several facets of EA use can be considered.

The research methodology employed for this dissertation uses the case study approach and the coding concepts from Grounded Theory Method to enable derivation of theory-based insights and discovery of generalized concepts applicable to EAFs. The analytic approach uses a closed interview procedure based on an adaptation of the Vision-Mission-Objectives-Strategy-Tactics (VMOST) queries. The level of alignment between other strategic capture artifacts and the interviews is investigated for explicit and implicit variations in the strategic objectives and context.

This research gives insight on the use of EAFs and provides a mapping of the VMOST queries to the inputs for an EAF, and offers an enhanced set of VMOST interrogatives. It develops an understanding on the use of qualitative data handling

methods within the context of software engineering focused case studies. The analysis of the data following the coding process delivered insights on the utility of the VMOST-derived instrument used during stakeholder interviews, providing a distinct comparison versus the existing documentation-driven approach. This work improves the usability for this powerful body of tools, providing impetus for wider adoption. By executing an active, empirical procedure with a working enterprise, various operational considerations in using the techniques are also exposed for documentation and, potentially, for future investigation based on the discovered theories.

- VMOST** – Vision-Mission-Objectives-Strategy-Tactics

## **Chapter One – Introduction**

This dissertation presents a case study investigation of a number of questions in software engineering and, more specifically, in enterprise architecture. These questions stem, in part, from software engineering's origins in the increased scope and complexity of problems tackled with computing-based solutions, which in turn gave rise to Enterprise Architectures (EAs) as a mechanism for aligning overall strategy and institutional contexts with information system (IS) and information technology (IT) management. Similarly, the methodological choices for handling experimental needs, and the resulting qualitative data, are influenced by the overall context of the desire to ground this work in the realities and responses of a working entity.

### **1.1 Background and Context**

Computer scientists, as the challenges of solving purely mathematical problems broadened as the problems became more general [17], became concerned with design, specification, and development of solutions and systems because of their increasing complexity and ownership costs [17]. The area of study and practice that developed in response to these needs has become known as software engineering [1][25][55], and has origins stretching as far back as the works of Dijkstra on program flow [22] and Wirth's concerns for program construction [74]. The broader modern scope of this community was devised as needs of complex software system customers was first articulated at several key early conferences [2][25], and today has cornerstones in the works of Parnas [34] and Brooks [8], among others.

A primary concern for this domain, that began as one of the original issues that concerned these early investigators and practitioners, has been the elicitation and development of software system requirements [63] that are both testable and representative of the needs of users and stakeholders. The challenges of engineering

requirements in turn gave rise to the realization that requirements are shaped by institutional context, existing systems and behaviors, and other disciplines and complexities [55][77][78]. The attempts to grapple with these considerations gave rise to the concept of the EA as a way to collect, document, and order these sorts of inputs [77][78].

### **1.2 Requisites for Enterprise Architecture**

To answer this need, an EA aims to provide “a coherent whole of principles, methods, and models” to realize the design of an “organizational structure, business processes, information systems, and infrastructure” [41]. The overarching goal of the processes, methods, and techniques used within the EA community is to “facilitate the translation from corporate strategy to daily operations” [41]. Enterprise architecture frameworks (EAFs) express how to arrange the assets of an EA and are intended to align an enterprise’s business goals and information infrastructure. This alignment is intended to allow for future growth and support a fuller comprehension of an enterprise’s strategy and business architecture as well as facilitate the synthesis of a supporting IS/IT strategy [50]. The creation of an accurate alignment is a major success factor for the application of an EA, and misalignments must be found in the early stages to allow the full value of an EA to be realized and prevent unwanted outcomes for the target enterprise.

### **1.3 Existing Environments and Potential Applications**

Numerous entities have come to rely on accumulated collections of IT-centric solutions for their operations and would benefit from being able to think abstractly both about their institutional goals and objectives and correlate their decisions regarding their computing needs to those thoughts. These enterprises can include entities as diverse as local governments, various sized businesses, and nonprofit sector institutions; this spectrum can thus span a range as diverse as a county school system to a local restaurant

franchise [50][53]. These institutions also provide a large community of potential adopters in the small and midsize categories, and therefore could widen the potential groups that benefit from EA use. It can be safely assumed that there would be a payoff in creating the alignment and embracing the notion of the information system (IS) infrastructure for these enterprises. The issue then becomes a question of approach and technique; specifically, what would the outcome be for a smaller or less-resourced institution attempting these techniques. A lightweight and simplified approach, versus the common and complex EA strategies, is the logical choice for a trial. This should allow the general question - if a single EA exercise can capture information to permit a suitable EAF to be started with a reasonable output, while accepting constraints of limited resources and expertise – to be pursued to a reasonable conclusion.

By creating a comprehensive set of cohesive models that describes the structure and functions of an enterprise, an EA can provide critical context and scoping information for the definition of a new software need [37]. In turn, by placing the idea for what is needed within the parameters of an institution, misunderstandings and intentions are better understood, as are the preferences for a solution [12]. This contextualization can help power better requirements creation within the enterprise. As the requirement is the basic working unit of software engineering practice, with which traceability, testing, and user expectations are tracked and handled, complete awareness of business context and objectives is critical to crafting well-written requirements [50]. Within software engineering, a requirement that is testable, traceable, verifiable, and potentially even contractually expressed is the preferred concept against which software development occurs.

In an enterprise environment, these requirements become the definition of functionality, constraints and quality attributes, expressing business needs and determining both costs and benefits. By creating a 360-degree awareness of the

enterprise's objectives, an EA and its artifacts can improve software engineering by helping better shape requirements for business objectives and realities. From a systems management perspective, this context can help inform IT purchase and design decisions for improvement in overall outcomes. By improving the utility, even at the risk of minor reductions in flexibility of these tools, a greater understanding of stakeholder intent is possible, as is an improved engagement on the part of all stakeholders in IT decision making, awareness, and overall institutional goals. Incorporating the broadest possible swath of stakeholder input, the resulting planning effort should be improved [50]. By engaging with the broader community, the results should reduce frustration stemming from the portfolio evolution since increased data and consideration of both individual and institutional objectives is achieved. Additionally, by engaging with individuals, the technical support staff also increase their visibility and enhances the overall perception of the computing specialist staff [39][46].

#### **1.4 Research Questions**

To help realize the larger benefits that would stem from improving the accessibility of the EA models, tools, and techniques, this research addresses questions derived from the consideration of an EA starting point selected for non-specialist application:

- Can a general lightweight elicitation, specifically Vision-Mission-Objectives-Strategy-Tactics, technique gather information suitable for conversion into enterprise vision and mission?
- Does engaging in the elicitation provide data sufficient to begin populating an enterprise architecture framework?
- Is qualitative analysis, specifically the Grounded Theory Method, effective and applicable in an EA context?

- How do results of Vision-Mission-Objectives-Strategy-Tactics map to an enterprise architecture framework?
- Can we achieve understanding across a complex stakeholder environment?
- Which, if any, of the Enterprise Architecture-Capability Maturity Model scores improve if the Vision-Mission-Objectives-Strategy-Tactics, Grounded Theory Method, Zachman Framework chain is employed?

To broach these questions, a systematic approach is required, as is a way to meet the difficulties of demonstrating improvements in comprehension and data collection without clearly quantitative measures.

### **1.5 Methodology**

To cover the needs of this study and meet standards of scientific rigor, the research applies a fusion of methods. The Grounded Theory Method [65] qualitative analysis technique is used to process the VMOST-elicited [64] qualitative text concerning an enterprise's vision, mission and business strategy objectives. In turn, this output is used it to populate the Zachman Framework [78], which is simple and flexible enough to be generally applicable to many environments. This work enables EAFs to better align the business environment with the IT infrastructure by accumulating required data for use as inputs with minimal resources and institutional friction. With these queries, this work addresses the uncertainties faced in current EAF compilation of strategic goals and provides a starting point for EA application.

To provide an overall structure for the investigation, this research utilizes a case study approach [24][75][76] as the primary research methodology. Specifically, this dissertation focuses on the application of our proposed lightweight EA elicitation technique with a real, representative enterprise. The implementation of the case study

provides a foundation for discussion of both the research technique and provides fixed points for future investigations that wish to vary one or more of the parameters.

### **1.6 Summary and Contributions**

This investigation contributes a multifaceted array of results for consideration, involving both the data, the approach, and the overall conclusions. These efforts provide an example of EA application in context of a small/midsize organization, and an illustration of the potential utility of an EAF for an institution of this type. This study affords a data point for qualitative technique application, specifically Grounded Theory Method, in an EA and EA-CMM context, for strategic data collection. This collection of evidence also forms a beachhead for further consideration of similar guided, structured EA application in similar contexts, in addition to advancing the use of qualitative techniques can be utilized in a software engineering context. Since the overall approach describes the sequences of steps followed, it provides a roadmap for other users, which increases the utility of EA methods and tools for smaller or less-resourced institutions. Further, by encouraging internal discussion on overall goals and objectives within an enterprise, a greater sense of mission is also likely to result from the employment of EA techniques [50][64]. The case study also contributes a setting for study of the lightweight EA elicitation technique as a way to solicit the initial input for an EAF.

From the initial trials to the full qualitative analysis, this work has demonstrated the utility of VMOST as a data solicitation tool, and demonstrate that VMOST-driven data gathering proved to be a wider net than a standard practice strategic capture [1][57][69][79]. In addition, the utilization of VMOST elicited data in a framework is well illustrated, as is the application of the Grounded Theory Method (GTM), providing a foundation for improved application of EA and demonstrating the potential timesaving versus the cost of separate planning exercises. The potential benefits of reducing the

learning curve and providing an easy path to the benefits stemming from full comprehension and alignment of goals and the actual vision and mission appears quite striking. By bypassing the barriers to entry to the critical elicitation functions of EA, the benefits arising from using these techniques can be made more widely available. Additionally, the use of the case study method has generated useful results for the exercise of the approaches being examined and has successfully documented the use of EA outside of the large institution and IT-specialist contexts. The combination of tools employed (i.e., VMOST and the GTM) has been within acceptable scope of effort and has created what appears to be a high level of overall comprehension regarding institutional objectives, context and goals.

This dissertation provides, with the above investigations, answers to the research questions posed in Section 1.4, and thereby provides a response set for those interested in use of EA and this toolchain. The VMOST tool provided, in an interview setting, provided a rich dataset suitable both for vision and mission construction and EA population as shown by the excerpts and the derived artifacts. The same evidence backs the conclusion that the GTM proved an effective tool for intense qualitative analysis in an EA context. That analysis, and the resulting understanding demonstrated, shows that awareness and understanding and illustrates the overall complexity of the environment. The exercise of populating the EA and references to existing information within the enterprise create an improved overall Capability Maturity Model score, especially within the process and development elements.

Additionally, this work has contributed three items to the professional works in software engineering. Collectively, the information they present covers several facets of the project. Those facets include the overall utility of the methods, the overall process, and a comparison against an alternative technique. Specifically, the first of these publications discusses the brief, initial round of interviews and the resulting data and

coverage it represents [58]. The second demonstrates the improved data gathering capability the process employed offers over conventional techniques and, potentially, use of already processed sources [57]. The third elaborates on the application of and methodology for the case study, should any other investigator or institution wish to reuse the approach [56].

### **1.7 Outline**

The next chapter in this dissertation reviews existing literature and research work in EA, EAFs, and business strategy elicitation that form the foundation of this research. The background of the VMOST technique is also addressed. Chapter Three elaborates the research methodology and overall process. The process includes application of a qualitative method, GTM, which is employed to process and analyze the interview data. Chapter Four addresses the execution of the study. This includes the general decisions taken as a part of the case study process. The initial impressions of the information gathered and analysis of the data are also discussed in detail. Chapter Five presents the necessary discussion of extrapolation and theory development that accompanies qualitative data. The potential applicability of these results to various scenarios and circumstances. Chapter Six presents the overall conclusions, contributions, and future work.

## **Chapter Two – Literature Review**

The work outlined in this dissertation combines and, in some cases, extends techniques from several areas, including: enterprise architecture (EA) [78], the Vision-Mission-Objectives-Strategy-Tactics (VMOST) [64] business strategy elicitation technique, and qualitative data analysis techniques, including Grounded Theory Method (GTM) [65]. Additionally, it uses the case study approach to organize and structure the overall research process [24]. This chapter discusses the background information and related work in these areas, including particular strengths and weaknesses and potential difficulties in application and contextual coverage.

These approaches provide a powerful collection of solutions but with the richness of some of these solutions comes at a tradeoff. The sheer textual volume some of the EA Frameworks (EAFs) can pose an obstacle. Similarly, the general nature of the business strategy domain's tools can make selecting among the generic assets a challenge.

### **2.1 Enterprise Architecture and Enterprise Architecture Frameworks**

EA, as a field, was created to provide businesses with guidance to assist them in achieving and developing their strategies and objectives. The associated EAFs define how to develop and employ the architecture. This resulting architecture is tailored to a specific entity or institution, the “enterprise” of enterprise architecture. This enterprise is not a general idea, but a specific construct. Minoli, for example, provides a definition for an enterprise, taken from The Open Group, of what is meant by an enterprise in this context of EAs and EAFs [50][54]:

“Any collection of corporate or institutional task-supporting functional entities that has a common set of goals or a single mandate. In this context, an enterprise is, but is not limited to, an entire corporation, a division or department of a corporation, a group of geographically dispersed organizations linked together by common administrative ownership, a

government agency (or set of agencies) at any level of jurisdiction, and so on.”

With this construction of an enterprise, the EA can be seen as the set of plans, models, and data that document the enterprise under consideration. The primary tools for EA are the enterprise architecture frameworks (EAFs) created to organize and guide the views, artifacts, and structures crafted for an application of EA [50]. These inform the practice of EA by shaping the thought processes and models used to create the overall enterprise-wide comprehension necessary for a successful information system (IS) [50]. While EA provides powerful mechanisms for enabling this shaping to occur, some burdens to utilization become apparent on closer investigation of the major implementations of the concepts, the frameworks. These burdens may be a hindrance to employment of these practices generally, and, even for the researcher, represent a significant operational burden. They also present some indirect biases reflective of their origins as tools for large-scale entities with fiscal or budgetary motivations.

### **2.1.1 Enterprise Architecture**

EA aims to provide a cohesive information technology (IT) strategy and infrastructure across an enterprise’s business units by aligning with its constituent business architecture(s) and organizational strategy [50]. The central purpose of an EA is to map “IT assets and business process and a set of governance principles that drive an ongoing discussion about business strategy and how it can be expressed through [information technology (IT)]” [50]. EAs become institutional assets, distinct from any particular software system or tool, and document the existing business and development processes, existing IS/IT infrastructure (e.g., hardware, software and networking

standardizations) and the various entities that assist in supporting the mission and strategic operations of an organization [11][14].

The expected output from developing a thorough EA is a plan that reflects the three- to five-year strategic business goals for an enterprise, typically documented in a Strategic Enterprise Plan [1][67]. Similarly, a Strategic Information Systems Plan describes the software systems to be developed within that same timeframe to support the business goals described in the Strategic Enterprise Plan [66][67]. These plans, in turn, provide order, focus, and context for achieving this articulated, overall goal, while helping to organize and identify a variety of data and stakeholder considerations. Overall, this creates a situation for improved deployment of resources and better overall results for participants generally [50].

### **2.1.2 Enterprise Architecture Frameworks**

An EAF provides guidance for documenting an EA, including rules and guidance, that provide common vocabulary and conventions for dividing an IS into a set of building blocks [50]. By providing conventions and structure, the EAF is a tool for defining the enterprise architect's work product, the artifacts that describe and communicate the architecture.

#### **2.1.2.1 The Zachman Framework**

This research employs the Zachman Framework [78], which is considered one of the standard approaches for representing the essential elements of an EA [27]. The Zachman Framework presents a two-dimensional taxonomy, as shown in Figure 1, to guide business and system architects to explicitly document the “building blocks of enterprises” [41]. The approach is based on six interrogatives (i.e., what, how, where, who, when and why) and six perspectives that relate to specific stakeholder groups (i.e.,

planner, owner, designer, builder, implementer, and worker) [78]. The intersecting interrogative-perspective cells provide a “holistic view of the enterprise” [41].

Since it was first published in the 1980s, the Zachman Framework has provided a non-prescriptive approach for data organization and classification. The approach provides a simple and flexible mechanism, typically used for the creation of representations of an enterprise for and by the institutional management. When applied by information technologists, it can also provide focus on IT issues, as a subset of overall of the business-planning problem. Originating as a mechanism for information architecture construction, the framework can reach into larger and narrow questions, ranging from large-scale managerial concerns to the specifics of systems design.

The Zachman Framework (cf., Figure 1) presents as a grid defined by six communication questions (i.e., Why/How/What/Who/Where/When) and five levels of reification (i.e., Contextual/Conceptual/Logical/Physical/Detailed). It functions as a schema to sort and order various inputs, including formal design documents and other artifacts, into a layout that identifies the personnel or stakeholders and problem addressed

	Why	How	What	Who	Where	When
Contextual	Goal List	Process List	Material List	Organization Units & Roles List	Geographical Locations List	Event List
Conceptual	Goal Relationship	Process Model	Entity Relationship Model	Org. Unit & Role Rel. Model	Locational Model	Event Model
Logical	Rules Diagram	Process Diagram	Data Model Diagram	Role Relationship Diagram	Location Diagram	Event Diagram
Physical	Rules Specification	Process Function Specification	Data Entry Specification	Role Specification	Location Specification	Event Specification
Detailed	Rules Details	Process Details	Data Details	Role Details	Location Details	Event Details

Figure 1: Zachman Framework, as a grid [78]

by the information. When populated, it can encapsulate a broad swath of information, ranging from high-level objects to location and events information, for consideration in multiple areas of problem solving [77][78].

#### **2.1.2.2 The Open Group Architectural Framework**

The Zachman Framework is limited in that it does not provide for a list of possible options of how to start on the critical, initial step of eliciting the necessary information for the schema [62] when documenting an organization's EA. This limitation is not unique to the Zachman Framework. In reviewing existing EAFs, including The Open Group's Architecture Framework (TOGAF) it quickly becomes apparent that this key EAF, and those it has influenced, have solutions for an enterprise with a large software portfolio but lack answers for how and where to begin to cast institutional goals in an EA-compatible way, which creates a non-trivial problem. For example, the 780 page TOGAF [54] offers preliminary information but little concrete explanation or suggestion of how to go about it at a step-by-step level. The Open Group's approach to a framework does not prescribe any final set of artifacts, providing instead a range of options for consideration and adaptation. It also incorporates an Architecture Development Method (ADM) and extensive explanatory material. By design, it is generic, but through the ADM provides guidance on how to craft for specific problem areas.

#### **2.1.2.3 Other Frameworks**

The Zachman Framework and The Open Group Framework fit within the larger family of EAFs, including having influenced other frameworks. As shown in Figure 2 [47][61] and discussed in [50], it is possible to see the large set of available options [36] that are available, but also note the heavy degree of relationship and overlap shown as the framework authors sought to accommodate common issues, topics, and problems.

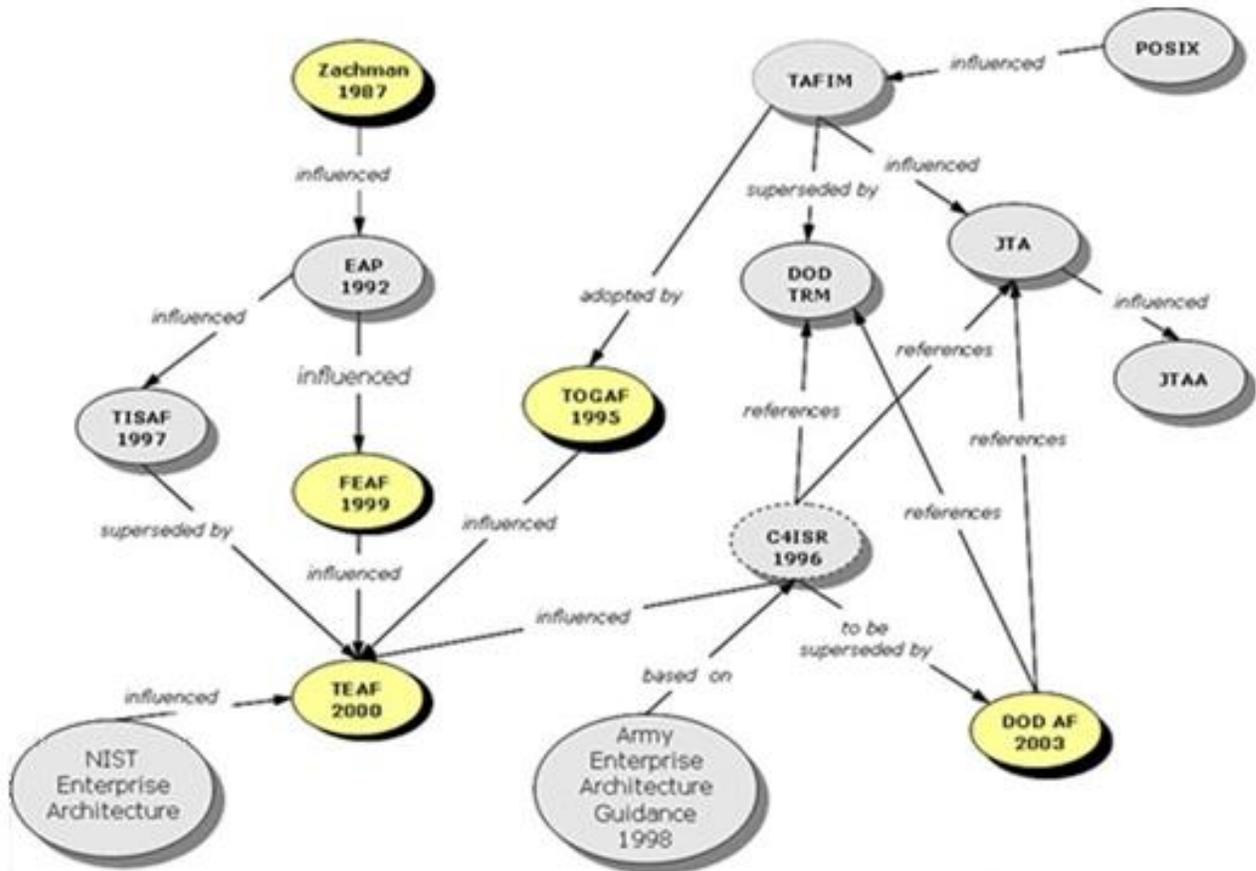

Figure 2: Relationships between various EAFs, from [47][61]

For example, the Department of Defense's framework efforts, including Technical Architecture Framework for Information Management (TAFIM) and Department of Defense Architecture Framework (DoDAF) [19], influenced TOGAF's creators, who also looked to provide common points for comparing and comprehending architectures across organizational and national boundaries. It seeks to ensure consistent development, and is prescriptive on which views are required. While military-centric, it can encompass a broad variety of enterprises, and offers an elaborate and complex family of views and concepts, permitting accommodation of a broad variety of institutions.

### 2.1.3 Alignment Approaches for Enterprise Architecture Objectives

The importance of verifying the alignment of EA objectives and business goals with the enterprise requirements and architecture of an enterprise software system has led to a number of approaches to ensure alignment and traceability. The Strategic Alignment

Method (SAM) advocates four cross-domain relationships (i.e., strategic execution alignment perspective, technology information alignment perspective, competitive potential alignment perspective and service-level alignment perspective) to underscore the importance and enable the alignment of IT and business strategic management [45].

Similarly, the Business IT Alignment Method (BITAM) provides twelve steps to align objectives and IT architectures. It does this by resolving the mappings between the business model, business architecture and the IT architecture layers of a business system [11]. However, as pointed out in earlier investigations [11], “these approaches both necessitate the elicitation of business drivers, architecture and strategic objectives from stakeholders and existing documentation without providing a structured, analytical process to do so.” This tool, like the EAFs generally, requires significant resources, time and expertise to identify, collect, and collate these requisites before proceeding on to a full utilization. In brief, an elaboration of the ways and means to accomplish this elicitation is not provided by this method.

These various methods, while providing guidance for achieving the alignment sought in EA, still do not provide a start point for data elicitation, leaving a need for inputs required to realize the benefits of EA application. While these techniques underline the importance of the alignment between objectives and the IT/IS portfolio, and provide insight when data is in hand, the absence of the data needed craft objectives and create understanding and awareness of portfolio assets leaves a gap in the tool chain for collection of the inputs.

#### **2.1.4 Enterprise Architecture Frameworks Synopsis**

EA and the EAFs have potential for wider use and utility, particularly given their ability to offer a holistic approach to a variety of management questions. The somewhat cloistered development and employment of the frameworks and methods has created a

rich and flexible body of work whose value could be more widely distributed through broader use. The lack of examples and guideposts for the population of EAFs hinders their utility across a broader range of enterprises. An EA perspective can provide valuable insight by encouraging institutions to view their information technology resources as part of a software portfolio – allowing objectives and institutional awareness to guide questions surrounding selecting, removing, and maintaining these assets.

### **2.1.5 Summary**

Enterprise architecture's frameworks are the most visible and dominant knowledgebase for this approach to IT/IS planning and decision making. As tools, they incorporate a wealth of concepts and approaches from business, computing, and engineering [50][54], and in ordering and capturing this knowledge are appealing as wide ranging solutions to the challenges faced by an institution looking to improve resource allocation and decision making, thereby opening a path to greater efficiency and effectiveness for all stakeholders. By increasing the number of communities that can successfully employ these approaches and, more generally, view their software and systems portfolio as a collection of assets, a balanced view of the use of technical means can be achieved that offsets the potential for erratic choices or disconnects between requirements and stakeholders.

### **2.2 Business Strategy Elicitation**

A mechanism for business strategy elicitation and formation that was not specific to any specialty or industry was necessary to execute this study. Rather than create one from scratch, a search of the literature yielded earlier work by Bleistein et al. [1][4][5], which had been applied to information taken from investigations focused on commercial enterprises to underpin work on IS/IT needs for varied objectives. This work, while valuable, is also occasionally limited by the scope of the largely commercial domains

from which it originates. The concept of business strategy as a general managerial tool provides both great flexibility and a challenge in the absence of specificity and suitable to a particular sector or purpose, potentially imposing a cost of familiarization upon users. A further investigation provided no examples of the application of these tools in an interactive setting with a “live” enterprise, or any use of this particular elicitation structure in an interview format. The prior efforts [1][4][5] in this arena had been limited to investigations based on published materials, not as a series of one-on-one engagements with current employees in a candid setting. Additionally, by taking the technique out of the usual commercial context, there would be an opportunity to investigate and publish a dataset with fuller disclosure and discussion than normal in this arena.

### **2.2.1 Sondhi’s Strategy Work**

The adaptation by Bleistein et al. [1][4][5] of Sondhi’s concepts and tools [64] for strategic capture have been previously applied to goal modeling techniques and processes. For this work, tools from that adaptation will be reused as to elicit strategic and enterprise related information.

Originally, Sondhi created the Vision-Mission-Objectives-Strategy-Tactics (VMOST) analysis as a strategic process, publishing it as an approach within his work *Total Strategy* [64]. These queries can be deployed for strategic analysis, to allow Vision, Mission, Objectives, Strategy, and Tactics to be specifically called out and discussed within an enterprise. This analytic method uses a set of interrogatives to defining the current organizational strategy [64], a subset of which, taken from the creator’s presentation of the ideas, are presented below:

- ***Vision***: To what extent is there a vision? How clear is this vision? Who owns the vision? Is the vision well communicated and shared by key people in the organization?

- **Mission:** Is there an explicit mission in the organization or is there an implied mission? Is the mission actually a mission or is it a goal? Is the mission appropriate and relevant for the vision and environment? What is the purpose of the mission? Does the mission provide a realistic view, from the management's perspective of the capabilities of the organization?
- **Objectives:** Are these *specific, measurable, achievable, relevant, time-bound*? Do they help fulfill the mission?
- **Strategy:** What are the basic elements of the strategy? How effectively is the strategy being implemented?
- **Tactics:** How is the strategy being carried forward on a day-to-day basis? Do the tactics reflect the aims of the strategy? Are the tactics coordinated between different parts of the organization? Are the tactics being monitored for success?

Together, these aspects allow pursuit of the core motivations and objectives of the institution in such a way to present a coherent view of the enterprise, as well as the both current practices and management objectives. By doing so in a general way and not tied to one specific industry or area, this allows for easy modification and customization to particular formats and arenas if at the cost of more immediate reuse by a specific field or specialization.

### **2.2.2 VMOST Adaptation by Bleistein et al.**

The work for this dissertation will employ the VMOST [1][4][5][64] set of questions to determine an enterprise's vision, mission and business strategy into the Zachman Framework [78] to better equip EAFs to align the business environment with the IT infrastructure. By applying these queries, this work will address the undirected nature of the existing EAF compilation of strategic goals by using the VMOST set of

- |      |                                                                                                                                                                                |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (1)  | What is the overall, ideal, end-state toward which the organization strives (vision)?                                                                                          |
| (2)  | What is the primary activity that the organization performs to achieve the end-state (mission)?                                                                                |
| (3)  | How are the responses to Question 1 and 2 (vision and mission, respectively) appropriate and relevant to the environment?                                                      |
| (4)  | Are the responses to Questions 1 and 2 (vision and mission, respectively) explicit or implied? How?                                                                            |
| (5)  | What are the basic activities and their rationale by which the organization competes with industry rivals?                                                                     |
| (6)  | What goals does the organization set to determine if it is competing successfully?                                                                                             |
| (7)  | What activities does the organization perform to achieve the goals in Question 6?                                                                                              |
| (8)  | How do the goals in question 6 support the response to question 1 (vision)?                                                                                                    |
| (9)  | What are the measurable objectives that indicate achievement of goals identified in Question 6, and what activities does the organization perform to achieve those objectives? |
| (10) | How do the objectives identified in Question 9 support the goals identified in Question 6?                                                                                     |

**Figure 3: VMOST Queries [64], as adapted by Bleistein et al. [3][4][5]**

elicitation questions [1][4][5][64] as an input to the Zachman Framework. VMOST surfaced in investigations of domain specific case studies and was created as a springboard for enterprises for crafting vision and mission statements [64].

The questions, shown in Figure 3, use language that avoids the need for deep expertise in systems engineering or business process, principally by avoiding the use of domain-specific or specialist terminology. Since the questions, as adapted for the earlier work, are general purpose and not structured around a particular industry or domain, they should be able to function as useful openers in the elicitation of EA input, as done in this work.

The Business Strategy Context Process (B-SCP) and goal modeling work by Bleistein et al. applied the adapted VMOST questions in conjunction with other tools to craft a goal model [5]. In [1][4] and [5], VMOST is used as an analysis tool for an existing institution with largely complete strategic information.

### **2.2.3 Strategy Elicitation Summary**

The work by Bleistein et al. [1][4][5] adapting Sondhi's concepts [64] provide a general-use mechanism that offers some prior history of strategy capture for methods similar to those used in EA. These efforts should provide the elicitation starting point required for EAF application within the case study approach [24].

### **2.3 Summary**

EA techniques, as part of EAFs like the Zachman Framework, provide the structure and tools necessary to comprehensively align complex stakeholder expectations, desires, and asset portfolios into an effective whole that advances an enterprise's overall goals. Elicitation tools like VMOST provide a starting point for collection of information that can be put together into an overall business strategy, and thereby allow an enterprise employing an EAF to have a concrete vision and mission.

This dissertation takes this background and context forward into a case study which will feed theory construction and provide overall business information. This needs of this investigation, by focusing on a more approachable, lighter weight strategy for EA will be best met by the Zachman Framework [78], as of the earliest EAFs and as one of the most flexible and least complex to apply. By extending the Bleistein et al. [3][4][5] use of the VMOST [64] concepts into an interactive interview format and implementing it in a non-commercial realm, the benefits of both a demonstrated prior feasibility and an advancement in potential practice are achieved.

The combination of these ideas – the adapted VMOST as elicitation technique and the Zachman Framework as a destination for the gathered data – provide a robust intellectual toolset, requiring only an overall frame with which to conduct the deployment and investigation. When placed within the case study construction as variously articulated by Eisenhardt, Yin et al. [24][75][76], an investigation to test these vehicles for their utility in conveying and ordering data for overall strategic alignment and understanding is possible.

### **Chapter Three - Research Methodology**

To properly pursue the research questions central to this dissertation, the conventional concerns of the scientific community must be met through methodology. Reproducibility, analytic mechanisms, procedural rigor – all must be provided. Further, this must be fit in with the structures of enterprise architecture (EA) and tools of business strategy, as outlined in the previous chapter, if the demonstration of a lightweight approach as outlined in Chapter 1 is to be achieved. This is particularly true in a study of this type, conducted on and with actual people, their responses, impressions. Additionally, the parameters and mechanisms must be sufficiently defined to accommodate the requirements of human subjects research. To meet these various requirements, the procedures for this research is rooted in a number of prior efforts for both case studies and qualitative methods.

This approach builds upon the parallels that can be found in qualitative methods processes, requirements engineering and enterprise architecture and further extends the high-level relationship between these three areas. With qualitative methods, text is the input, with requirements engineering the key artifact is a set of textual criteria to be met derived from data collected via a variety of potential strategies, and enterprise architecture similarly is informed and responsive to textual inputs. All three areas have objectives for their analytical processes and treatments. For qualitative methods, a composite set of information is rendered into a single overall description. Paralleling this, requirements engineering seeks an overall design that can used to build a deliverable. EA's goal is understanding, context, and alignment to an articulated goalset. Similarly, all have artifactual outputs, qualitative methods producing diagrammatic and sensemaking outputs, which are comparable to the modeling products of requirements engineering or the planning documents created for EA. Table 1, which builds upon and extends ideas

**Table 1: Relating Qualitative Methods, Requirements Engineering, Enterprise Architecture, adapted and extended from [11][12]**

	<b>Qualitative Methods</b>	<b>Requirements Engineering</b>	<b>Enterprise Architecture</b>
<b>Input</b>	Text, such as interviews, field observation notes, documents	Qualitative text such as interviews, use cases, ethnography, specifications, standards, definitions/references	Stakeholders, Enterprise/Institution IT/IS assets, Goals
<b>Analysis Objective</b>	Synthesis of multiple perspectives into single description	Elicitation of viewpoints into specifications and system models	Understand goals, context, constraints. Apply that information in way that places data in appropriate layers
<b>Output</b>	<i>Representations</i> using narrative methods and process diagrams, theory	Representations of specifications in semi-formal models (UML), ER Diagrams, SysML, <i>requirements</i> documents	<i>Enterprise Architecture Plans</i> : Strategic Enterprise Plan, Strategic Information Systems Plan

from [11][12], collects and illustrates the highly analogous inputs, objectives, and outputs for the research methods, engineering tools, and architectural approaches for this problem space.

### 3.1 Case Study Approach

The case study approach can be used as a method to both gather observational and other data, which in turn can be used to feed a theory development process [24]. The works of Eisenhardt on theory creation [24] and Yin on the design [76][75] of a case study are foundational sources for this approach. It has been employed across a variety of disciplines – including information technology [10], medicine [70], business [6][40][73], marketing [23], and management [68] – for both scholarly and applied research.

By addressing the various concerns regarding the specificity and reproducibility of case study based data, this scholarship opens the door for application of these methods across a broad range of disciplines and questions, so long as known limitations are accommodated. This approach has the advantage of providing concrete examples to other

interested practitioners, and if executed with sufficient regard for the observed limits provides a powerful illustration of the utility of the approach.

Eisenhardt's synthesis of a variety of work, including Yin's [75][76], Huberman's and Gersick's, provides a guide for handling qualitative data from a case study for theory development [24]. It provides a general guide to the steps in the process, and details the induction of theory from case studies. It addresses an iterative method with a very tight linkage to data, and considers factors in identification of theory quality and evidentiary grounding.

### **3.2 Case Study Design**

The work of Yin surrounding questions of case study construction and design demonstrates that the case study, as a tool, can cope with a technically distinctive solution with more variables of interest or concern than data points by providing, at completion, one result even when multiple evidence sources are relied upon [75][76]. It also provides overall guidance on how to engage in and discuss a case study, including addressing research design, and planning, methodological questions, and overall rigor [75][76].

This work also posits that a case study can cope with technically distinctive situation in which there will be more variables of interest than data points; provides one result even while relying on multiple evidence sources. The body of work encompassed by Yin's efforts addresses questions of design, of focus of study, questions of inference, and advice on practical methods [75][76].

By elaborating on the description, categorization, and classification of case study, these extensively employed references provide insight into how to view case study information, and properly articulate the nature of what will occur in the process of executing the case study and executing the subsequent analytic processes. Yin's work [75][76] also aids in avoiding pitfalls, highlighting known issues and risks identified

when engaged in this sort of work. In particular it addresses concerns over the unit of data collection/unit of analysis issue [76]. While weighted to the social science's traditional "field work" disciplines, there are forays into more quantitative communities and areas through engineering or technology grounded studies.

### **3.3 Qualitative Analysis**

The key output of the field work process, the notes and transcripts of the interviews, are textual. These data are qualitative results, and require an analytical procedure suited to drawing conclusions from this sort of information. For this research, the Grounded Theory Method (GTM) a subset of the method, was ultimately employed for the analytic needs for this work.

It is of note that there are other methods for possible employment [15][16][18][26], including ethnographic, phenomenological, historical, critical social, and pilot (also known as cognitive) testing. Similarly, there are approaches found in the ethical inquiry, foundational research, and philosophical methods, but these are generally used in specific areas and arenas. Of those approaches not specific to particular problem spaces, there is also phenomenology, which is concerned with impressions of real events, there is critical social research is specific to symbolic needs. Another approach, the historical, permits reflection upon past events, opening the way to considering answers to current concerns and questions through examination of the past [15][16][18][26].

Another option, called the generic or pragmatic research, is available. However, this eclectic approach is not particularly suitable for providing a suggested effort or concept. Another option, grounded theory (originally called constant comparative) [30], is based principally in and focused almost entirely on the collected data itself, and is particularly suited to interview derived and observational data sources, as well as surveys

and extant record investigations. This method, employed as part of the research process for this work, is discussed further in the next section.

### **3.4 Grounded Theory Method**

The Grounded Theory Method (GTM) was created in a joint effort by sociologists Barney Glaser and Anselm Strauss in 1967 as a mechanism to support the creation of theory from the analysis of data [11][14][30][31][65]. Over time, varying approaches to the GTM evolved. For this research the variant described by Strauss and Corbin, which provides a sequential approach to consideration and application of the Method.. As the coding sequence described can be used as a step-wise, procedural approach, a subset incorporating the coding stages was used in combination with the case study structure. This combination may, as a less abstract approach than other techniques for employing the GTM, may also improve the likelihood of reuse and possibly reduce some potential impacts of subjectivity.

The method is based on a multi-stage analytic treatment – codes, concepts, categories, theories – that allows for the generation of theory [65]. Codes are key ideas, taken from the qualitative data, which are then grouped into categories which in turn underpin the derivation of a theory. The theory is a hypothesis which has been arrived at backwards from the usual research construct, and is based on the information collected.

The Grounded Theory Method (GTM) is a technique created to allow creation and discovery of theory directly from qualitative data analysis. The method includes a multiple stage sequence of data coding to enable full comprehension of information [11][14][30][31][65]. For this project, the GTM coding process (shown in Figure 4) is applied to the qualitative data collected from interviews to identify core concepts and contexts necessary for an EA.

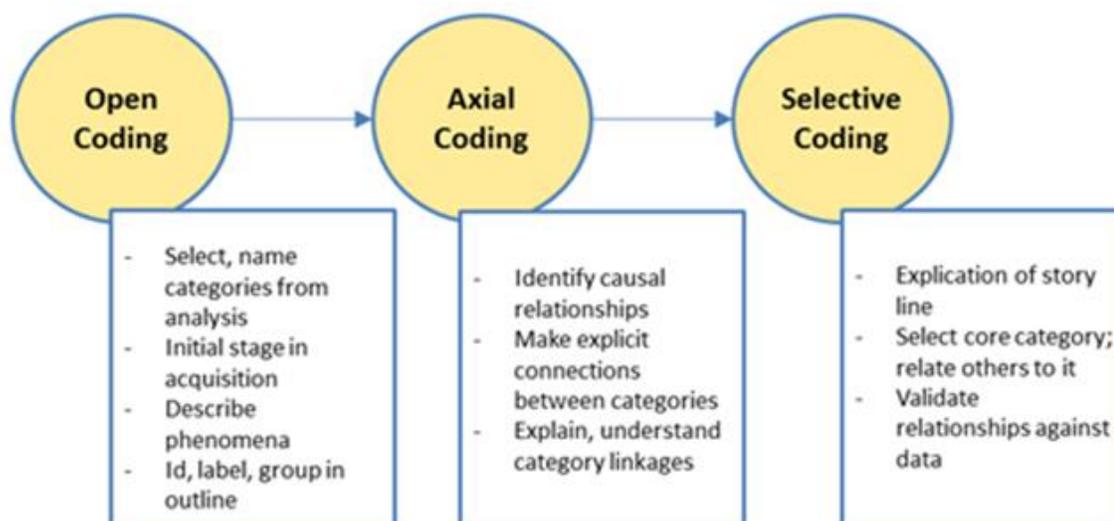

Figure 4: Normal GTM Coding Flow (Without Backflow)

### 3.4.1 Basic Strauss-Corbin Grounded Theory Method Application

The Strauss-Corbin approach [9][65] recommends that analysis of data and development of theory be done as concurrent steps that will be repeated until new data does not modify the theories developed, rather than conducting them as separate and distinct phases. Further, Glaser [30] claims that any item of data encountered in the process by the researcher is an input.

A primary objective of GTM [30][65] is to allow the problem to be identified and understood. With the creation of mutual comprehension, the likelihood of an effective solution is increased, and the theory generated will be reliable. This is achieved through the use of the three types of coding, show in Figure 4 and discussed in detail in the following sections, as informed by [11] and [31].

#### 3.4.1.1 Open Coding

For this research, a case study that employs an interview as an instrument for data elicitation, the output from the fieldwork efforts is a body of semi-structured qualitative data, the transcripts of the interviews with the participants. To begin application of the GTM, open coding is the first step. This step is where phenomena are named, identified and categorized [11][12][65] and is done as a two-part process. The first phase requires

the identification of concepts, the core ideas found within the phenomena being evaluated. Anything relevant to the proposal under consideration is considered a concept that is within the scope of requirements, strategy, or objectives. The second phase of the open coding process requires the identification of properties, which enrich the description of the categories by capturing attributes. Within business objectives and EA generally, these represent the more concrete aspects that will likely shape IT and software-centric decisions. Both of these phases should involve multiple rounds of consideration, ensuring complete discovery of concepts and their aggregation into categories.

#### **3.4.1.2 Axial Coding**

Axial coding, in which codes identified in the open coding phase are related to each other either inductively or deductively, is the process of linking the categories and concepts found in open coding to each other [11][12][31][65]. By divining linkages, usually causation based, basic settings for relationships can be built that frame various elements in a way that includes conditions, consequences, and the phenomena themselves. The axial codes customarily describe circumstances like causation, group membership, and concept hierarchy so as to build a conceptual picture from the data. By allowing the relation of codes, categories, themes, and other relationships, a more ordered picture of the data emerges from the mass of open codes. Given a target context of an EA/EAF, and, indirectly, requirements and decisions as the outputs from the coding stages, the axial codes resulting from this process are to present as broader collections and themes for objectives and criteria for decision making, as well as distinguishing points for differentiation between large classes like user types for systems and modes and patterns of operation.

### **3.4.1.3 Selective Coding**

Selective coding is the stage where one category is selected to use as the core or central category [11][12][31][65]. This selection is then used as a fixed point, and all other categories are then related to it. By choosing this unifying thread around which all other ideas can be related and drivers for the overall institution are identified [65], and allows overall perspective on the storyline that underpins the nature and contexts for the institution. This code is used to join the other codes, and should be reflective of the main participant concern. The selection of this code can also enable filtering and focus on the principles constructs and ideas that unify the overall data. For EA/EAF, and software engineering needs, this selective code should provide insight into where the point of balance is for decision making and design tradeoffs, the motivation and overall desire of the institution.

### **3.4.1.4 Sensemaking**

Sensemaking involves turning circumstances into a situation that is comprehended explicitly in words and that serves as a springboard into action [65][71]. This sensemaking step is what links this technique effectively to problems found within the requirements engineering area of the computing disciplines, as overall it informs an overall comprehension of the problems and considerations found within the community that will be impacted by the software or system. This enablement has been demonstrated in other work in this area, including in [11].

### **3.4.2 Grounded Theory Method for Software Engineering**

GTM has been previously applied to the derivation of enterprise system requirements in the area of requirements analysis [11][31][32][33]. This work demonstrates that the application of GTM to a software engineering problem space can be effective, and enables systemization of alignment and enhanced traceability. Other

investigators have undertaken to validate the application of GTM within a general requirements engineering context, and as input for system model solutions including Unified Modeling Language (UML) [11][12]. These studies noted the similarities between GTM constructs and the more customary formalisms of software engineering. Traceability through the interim documentation was also noted as a benefit of using GTM for such problems [11][12].

By applying the textual-data-driven coding procedures of GTM to datasets taken from complex multiple stakeholders, varied-objective, multi-faceted institutions, the GTM conceptual constructs (e.g., concepts, categories, properties, etc.) allow for enhanced traceability and documentation trails. These incremental pieces can improve both the overall alignment of and traceability to design features and goals. Such artifacts also increase the analyst's perception of any missing items of information as well demonstrate orientation toward enterprise- and stakeholder-sought outcomes [31][32].

### **3.5 Summary**

The case-study body of literature provides solid evidence for the employment of a mature family of techniques and processes for the level of study necessary to accumulate sufficient data and context to use as input into a theory development activity.

GTM provides a rigorous method for analysis of semi-structured, conversation-derived data, allowing for significant concepts to be discovered and theory to be evolved and developed from a variety of sources. This method is uniquely suited to working with the broad variety of data-types and inputs accumulated and solicited in the process of working across a broad spectrum of disciplines, objectives, and environments typical of a modern multiple role enterprise. By allowing for this data to be processed and analyzed in a discipline and specialization agnostic fashion, a fuller and more comprehensive conception of the enterprise and conformance to its strategic goals is likely to result.

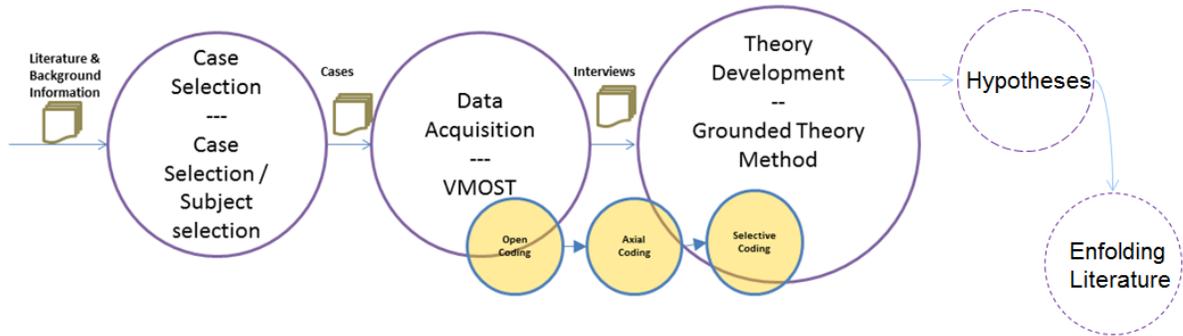

The case study process, combined with the GTM for qualitative data handling, will provide an overall structure for the research effort, as detailed in Chapter 4.

#### **Chapter Four – Case Study Execution**

In the preceding chapter, the basic scaffolding for employing a case study is presented, as is the background and methodology for accommodating the qualitative data with scientific rigor. Prior to that, the mechanisms and frameworks of enterprise architecture (EA) as well as the business strategy tools for eliciting input are elaborated. This follows the articulation of the motivation for this dissertation, the concept that the portfolio approach that EA advocates for decision making on information system (IS) and information technology (IT) needs and assets.

This chapter elaborates on the configuration of the case study approach conducted for investigation of these concepts, beginning with the selection of the enterprise to be studied, as this was the primary driver for the research process. The case study approach utilized here is informed by the work of Eisenhardt [24] on design and theory creation and Yin [75][76] on the design and conduct of the study itself. Their foundational scholarship addresses a variety of concerns and considerations surrounding the specificity and reproducibility of case study acquired data, and allows for the application of these methods across a broad range of disciplines and areas of study, so long as known limitations are acknowledged.

The results of this approach have the benefit of providing actual usage feedback, based in concrete examples and become illustrative to other interested practitioners and scholars. Yin's work also posits that a case study can cope with a technically distinctive and intricate situation in which there will be more variables of interest than data points, and provide one result even while relying on multiple evidence sources. It also provides overall guidance on how to engage in and discuss a case study, including addressing

**Figure 5: Overall Research Process**

research design, and planning, methodological questions, and overall rigor. The research methodology utilized in this dissertation, outlined in Figure 5, to evaluate our proposed lightweight EA elicitation technique utilizes Yin’s case study approach [75][76] with an overlay of the Grounded Theory Method (GTM) coding steps [65]. Each of the steps of the research methodology is discussed in the following subsections.

#### **4.1 Selecting the Case**

A case study begins with a definition of the entities and population under consideration for the study, so that the appropriate controls, scoping and eventual limitations are apparent and identified. This selection defines the overall context and, therefore, the generalizations from and applicability of the overall results and any theory based on the data.

Eisenhardt’s synthesis of the various considerations in executing of a case study emphasizes the centrality of selecting an appropriate group for study. This definition is a central factor in reducing the opportunities for “extraneous variations” and allows for generalization of limits [24]. Within that model, two rounds of population choice would be necessary. The first would be driven by the theoretical objectives, the second by statistical and coverage considerations.

#### **4.1.1 Selecting the Enterprise for the Case**

After identification of the chief question(s) for the research and adoption of the case study approach, the next step was identification of and engagement with an enterprise. Concerns at this point in the sequence included willingness to participate, toleration of the presence of outsiders in the form of the research staff and permissibility of using data. The latter, with commercial enterprises, sometimes limits the publication of results with complete, unfiltered examples.

In this dissertation, a representative of the staff of a regional U.S. University's library, during an unrelated discussion, expressed an interest during the initial planning stages for this study. The use of an institution of this sort in this research afforded numerous advantages, chief among them the core of the staff, which numbered in excess of 50, are all generally accustomed to research and researchers. Local conditions also included a complex set of committees for internal management, a diverse set of roles and functions, responsibilities spanning everything from curricular concerns to legally mandated records retention, frequently including off-hours and off-site expectations.

The local information technology (IT) environment was also of significant complexity, involving multiple public and internal web presences and mechanisms, a complex set of standards for data interchange, local support mandates for multiple sets of systems, and stewardship responsibility for the licensing of a variety of digital and physical data sources. Investigating an enterprise with an IT asset portfolio but limited access to specialized staff, the research team was presented with a set of circumstances that is not unusual for an academic sector entity, including the absence of the profit/loss metric, which offered an opportunity to distinguish this work from various prior studies [1][4][5].

The diversity of both the stakeholder population, including a primary user community of 23,000, and the varied objectives and needs they present, as well as relationship to external and parent entities, combined to make this a rich environment for

application and evaluation of our approach. These connections included involvement in the collective university and library system created by the state government, plus interaction with the larger academic library community. The relative ease of scheduling and access, and willingness of the staff to participate, also proved a significant asset.

Overall, the library is comparable to a large number of peer institutions, and shares a profile generally similar to even more entities. As an institution with stakeholders, external and internal objectives, assets, a budget, staff, and a need to reconcile all these facets, it is no less an enterprise than those previously studied [3][4][5][49]. It exists as an IS “heavy” institution, confronted with an evolving ecosystem of social media systems and choices, and is constrained – again like the original enterprises employing EA – by staffing availability and technology expertise. It also has an evolving mission and, like any enterprise, a need to budget both time and resources.

#### **4.1.2 Choosing Participants**

With a subject enterprise for this case study evaluation identified and with the management allowing staff to participate, the next step in the case study approach is the selection of which staff or stakeholders would be asked to participate as subjects in the case study. In order to cast as wide a net as possible while conforming to the human subjects research parameters that were approved, the second set of decisions required consideration of the library as a system and the multiple roles and functions it and the staff performed.

This stage established which staff within the enterprise under consideration would be interviewed as a part of the data collection process by starting with an existing organization chart and staff directory of the library. To maximize coverage and cast as wide a net as possible, participation by as broad swath of the staff was targeted; ultimately over 40% of the full-time/professional staff would become participants.

Additionally, involvement by staffers representing the operating groups of the four major functional divisions was achieved, allowing consideration across multiple roles, viewpoints and sets of responsibilities.

#### **4.2 Instruments and Protocols**

To avoid unnecessary variables and to ensure consistent behaviours, the instruments and protocols for a case study must be defined. In this research, that required a standardized set of questions as survey/elicitation instrument, and a well specified interview strategy.

The Vision-Mission-Objectives-Strategy-Tactics (VMOST) method, adapted as questions in [1] from [64], was the initial instrument used for this study; this instrument was later extended as a result of the initial round of interviews based on the initial data. The original VMOST questions (shown in Figure 3), were selected as a generic mechanism for developing an enterprise architecture (EA), are phrased in such a way as to make them meaningful outside the specialist realms of business strategy or software engineering. The VMOST questions are also not tailored to a specific industry and have been used previously in both business strategy [64] and information technology scenarios [1], giving a reasonable confidence to their reuse in this new application.

The interviews conducted using the VMOST questions generated a set of seven and a half hours of recordings from the 23 participants that form a broad base of responses to the VMOST questions, made broader still by allowing participants to request clarification of the question and otherwise comment on the phrasing of and impression made by the question. These recordings, more than 100 pages of qualitative text once transcribed, are combined with the concurrent notes for each interview for asynchronous analysis of the responses by a second person, experienced in application of qualitative analysis, , which the literature [24] posits as a step likely to increase complementary insight and in this instance serve as a check on the application of GTM. Such additional

insights lead to richer data and identification of several additional insights. The additional consideration of the information also, generally, leads to greater confidence in the analysis, as differing perception adds to the empirical grounding of the hypotheses derived. When this method was joined to a qualitative data collection form, and applied in a recorded close interview format with open-ended responses, a multi-format data collection strategy was created.

The resulting transcripts required some additional manual processing before further use. The transcripts were produced by an external, independent transcribing firm to ensure accuracy and clarity, and then are redacted to remove certain types of identifying information, including names, for protection of the identity of participants. Extraneous capture, including occasional anomalies and interruptions, acknowledgement of interview parameters, and some conversational pauses and digressions were also removed.

By going beyond a routine pigeonholing of answers-to-questions, it is possible to have a holistic interpretation of a full interview. This is in accordance with the Mintzberg synergy concept [51], discussed in [24], that says that theory can be constructed from “rich description”. It also led to greater notice of subtle shadings in phrasing and vocabulary and of differences arising from distinct specialties and responsibilities amongst interview participants. It also distinguished areas where “backtracking” to answer prior questions by respondents and other, conversational interaction “moments” occurred.

### **4.3 Fieldwork**

After the institution, personnel and study instruments had been selected using the case study approach [24], the next step called for by the methodology is the fieldwork. This is the actual execution of the designed study upon the selected subjects and with the chosen instruments. In this work, this was the actual conduct of the interviews. This was

followed by transcription of the collected recordings and some post processing of the transcripts. The processed transcripts were then united with the notes taken during the interviews.

It became apparent as the fieldwork application and evaluation continued that the one-on-one interview format exercised the questions in such a way as to capture nuanced reaction. The combination of notes and recordings provided the required mechanism, one that permitted interaction and feedback. This approach also appeared to reassure the participants on any concerns they may have had concerning the use of the resulting data and the objectives of the experiment, a critical consideration with human subjects. Multiple subjects were curious about both the goals and the ultimate outcomes of the experiment, and the in-person encounters allowed a much more fluid discussion. The interview format proved that it could provide for the need to acquire both the responses to and about the questions.

#### **4.4 Data Analysis**

Following the data collection and initial processing in the fieldwork stage, the case study sequence moves into the analysis portion of the investigation. This entails attempting to identify trends, repeated themes, and other constructs and concepts in order to understand the overall nature of and information contained in the data. The interview sessions and subsequent processing and editing yielded a set of transcripts based on the primary interviews of staff. A subset of the Grounded Theory Method (GTM) was used to analyse the qualitative data [65]. This subset was the three phase coding technique (i.e., open, axial, and selective coding). A set of sample intermediate data is shown in Table 2, with associated codes and demonstrates the stages of the GTM coding sequence used in this research as a part of the sensemaking process of analysing the data elicited from conducted interviews using VMOST questions. The “Interview excerpt” (shown in the second column of Table 2) cells contain key words or phrases, with fuller context

beneath, that are used to inspire the initial, “open” codes that identify concepts, vocabulary and ideas for consideration [65]. The open codes (shown in the third column of Table 2) are words and phrases driving understanding and comprehension of the overall enterprise, generated from both the phrases and contextualization of the interviews [65]. With the given examples, the open codes are annotated based on impression and initial reflection(s) of the coder. The open codes are then grouped and ordered with axial codes (shown in the fourth column of Table 2), which typically emerge as the set of open codes are considered and studied. Selective coding entails choosing one of the axial codes as the central or primary idea (not shown in figure), which is what is perceived to be the touchstone to which the others can be related for overall consideration of the situation [65].

Table 2: Examples of interview excerpts and quotes, with open and axial codes

Ex.#	Interview Excerpt Quote	Generated Open code(s) underlined, with note(s)	Axial Code(s)
1	research center for students, faculty (I-1) <i>...where does the library want to end up? Oh, I think as being a research center for both students and faculty. Interviewee: The place where they turn for their research needs.</i>	1. <u>research center</u> – idea that enterprise is key to investigations 2. <u>Students, Faculty</u> – differentiation between customer types	<ul style="list-style-type: none"> <li>• Larger goal</li> <li>• Stakeholders</li> </ul>
2	Gathering place (I-1) <i>...We acknowledge that we want to be a gathering place for students. Interviewee: But also, that we serve as the portal. The place where they can go to get information, ...</i>	1. Gathering place – perception of library as a physical space to use	<ul style="list-style-type: none"> <li>• Provided service (specifically physical)</li> </ul>
3	expectation that search be suitable easy straightforward as Google (I-5) <i>but they've sort of come up with this expectation that everything that they search for ought to be as suitable or as easy...and straightforward as Google is, which we would like to see as well but it's a whole different model.</i>	1. <u>User expectation</u> – what is desired 2. <u>Scoring</u> – as a target, this should be measured by surveys, etc	<ul style="list-style-type: none"> <li>• Assessment/Metrics</li> </ul>
4	tailor to what is being taught (I-21) <i>Or it's not just up to us. But we try to tailor our collection to what's being taught at Towson and it does have a curricular slant to it.</i>	1. <u>Curriculum support</u> – course support often identified as key aspect of functions/goals	<ul style="list-style-type: none"> <li>• Provided service (specifically curricular)</li> </ul>
5	Phone calls, Jing, Captivate... (I-1) <i>people would phone me for help. Can you walk me through this? Now, with tools like Jing and Captivate, you can send them a little mini tutorial that shows them how to do something, and a picture is worth a thousand words.</i>	1. <u>Provided service</u> – multiple interviews included lists of technologies for interaction	<ul style="list-style-type: none"> <li>• Provided service (specifically virtual)</li> </ul>
6	learning how to learn (I-3) <i>... our profile is that we offer this service that is valuable to you as you are a student and we hope you can take this, it's all, learning how to learn and libraries can connect you to information...</i>	1. <u>Provided service</u> – varied forms of training for students	<ul style="list-style-type: none"> <li>• Provided Service (General)</li> </ul>

Ex.#	Interview Excerpt <i>Quote</i>	Generated Open code(s) underlined, with note(s)	Axial Code(s)
7	feedback from faculty (I-2) <i>Some level of faculty feedback. ... Yeah. Yeah, we have our liaison, liaison [ to the] speech department, so I think it's just being mindful of the needs that your user population has expressed.</i>	1. <u>Faculty feedback</u> – numerous inputs from faculty, including committees and surveys/forms	<ul style="list-style-type: none"> <li>• Assessment/Metrics</li> </ul>
8	information literacy instruction – handouts (I-22) <i>I would say that information literacy instruction, classes, and, ... all of the handouts and everything on the web and everything the administration does to communicate and further those goals.</i>	1. <u>Information literacy aid</u> – standard item, created to support classes and research areas	<ul style="list-style-type: none"> <li>• Providing Service (General)</li> </ul>
9	LibQual (various; I-20) <i>Measurable objectives. Well every 2 years we would have a LibQUAL survey to measure satisfaction. There's a heavy effort to recruit people to answer that survey.</i>	1. <u>LibQual (survey tool)</u> – institution-type-specific survey instrument	<ul style="list-style-type: none"> <li>• Assessment/Metrics</li> </ul>
10	provide access – physical virtual, on campus or remotely (I-4) <i>...we provide access to materials that support the curriculum so in that way it's relevant. We don't purchase or subscribe or provide access to material that doesn't directly support the classes, the degree programs ... providing that access both on campus and remotely.</i>	1. <u>Provided service</u> – being available in formats, at times needed by customers	<ul style="list-style-type: none"> <li>• Provided service (general)</li> </ul>
11	support academic enterprise (I-5) <i>... supporting academic enterprise as a place to find and access information, process it, and analyze it, and presumably produce it in some cases.</i>	1. <u>Academic enterprise</u> – fit with overall institutional objectives, style/culture	<ul style="list-style-type: none"> <li>• Larger goal</li> </ul>
12	“what rises to top” in search (I-5) <i>one of the things that the libraries provide as compared to something like Google is how the sort of selection or what rises to the top</i>	1. <u>Search order</u> – providing integrated search capability with useful behaviors	<ul style="list-style-type: none"> <li>• Providing service (virtual)</li> </ul>
13	collection use as a measure (I-10) <i>... expensive to buy these databases so we keep usage statistics and that goes into...</i>	1. <u>Usage measure</u> – budget for assets is carefully managed, requires tracking for utility justification	<ul style="list-style-type: none"> <li>• Assessment/Metrics</li> </ul>

Ex.#	Interview Excerpt <i>Quote</i>	Generated Open code(s) underlined, with note(s)	Axial Code(s)
14	student and faculty success is foremost in mind of university (I-23) <i>...our goals are to support again the success of our students and our faculty and that is ... foremost in the mind of the university.</i>	1. <u>Larger goal</u> – parent organization has multifaceted objectives that must be considered	<ul style="list-style-type: none"> <li>• Larger goal (General)</li> </ul>
15	academic to business model (I-17) <i>Quite frankly academia is moving toward that business model.</i>	1. <u>Mental model</u> – evolution of considerations, practices within peer group	<ul style="list-style-type: none"> <li>• Service Quality, Models, Practices</li> </ul>
16	Protecting privacy (I-16) <i>within our bounds of protecting people's privacy... we keep quite a bit of aggregate information on what's done here.</i>	1. <u>Protect privacy</u> – expectation within community of practice; general expectation of stakeholders	<ul style="list-style-type: none"> <li>• Larger goal</li> </ul>
17	Collection maintenance (I-15) <i>...maintaining a collection that supports those activities as well so we are doing collection development and acquiring new materials or even reading new materials to make sure that we have a collection that supports the needs of the institution...</i>	1. <u>Collection upkeep</u> – physical, electronic assets require curating to remain useful, up to date	<ul style="list-style-type: none"> <li>• Providing service (physical, virtual)</li> </ul>
18	"other communities we serve" (I-16) <i>...we have that other.... Those other communities that we serve.</i>	1. <u>External customers</u> – as public institution, and within peers, cooperation expected	<ul style="list-style-type: none"> <li>• Stakeholders</li> </ul>
19	and leading in university system (I-15) <i>...functions of the organization are aligned with our user's needs, forging partnerships, and demonstrating leadership on campus and in the university system.</i>	1. <u>System Role</u> – within immediate group of peers, staff/institution can take lead on common issues	<ul style="list-style-type: none"> <li>• Providing service</li> <li>• Service Quality, Models, Practices</li> </ul>
20	at table – thought of (I-21) <i>We're not always at the table, we're not always thought of. So maybe that redoubles the pressure on us to sort of generate all this stuff on our own.</i>	2. <u>Role considered</u> – As service component of larger institution, engagement with other arms important	<ul style="list-style-type: none"> <li>• Larger goal (intra-institutional)</li> </ul>
21	collaboration space (I-20) <i>... a place that students think of to be a sort of a central location where they can do research, they can collaborate well with one another.</i>	1. <u>Collaboration resource</u> – as hosting location, collaboration enabler	<ul style="list-style-type: none"> <li>• Providing resource (physical)</li> </ul>

Ex.#	Interview Excerpt <i>Quote</i>	Generated Open code(s) underlined, with note(s)	Axial Code(s)
22	effectiveness surveys(I-18) <i>...done a LibQUAL survey so we've done a standardized survey, to measure how we're doing. We ask faculty and staff one on one...</i>	1. <u>Survey results</u>	<ul style="list-style-type: none"> <li>• Assessment/Metrics</li> </ul>
23	thinking about metropolitan (I-21) <i>being metropolitan, ...in some sense I think it is really valid.</i>	1. <u>Metropolitan</u>	<ul style="list-style-type: none"> <li>• Larger goal (general)</li> </ul>
24	content management services (I-15) <i>all functions of many areas of the library including research services and our content management technical services and collection development... providing more support to our distance learning students and faculty...</i>	1. <u>Electronic content</u>	<ul style="list-style-type: none"> <li>• Providing service (virtual)</li> </ul>
25	annual staff review (I-14) <i>...comes into play when you have annual reviews and stuff like that...</i>	1. <u>Staff review</u>	<ul style="list-style-type: none"> <li>• Assessment/Metrics</li> </ul>

#### 4.4.1 Open Coding

To apply the GTM, the first step, open coding, requires the identification of key concepts, ideas, and phrases. Given that the data in this instance is derived from interview data, open coding will also help eliminate unintended or conversational artifacts. Ultimately, the identification of ideas and phrases results in a set of open codes that embody the concepts presented by the data.

In this case, more than 500 open codes were identified. This was recorded in a spreadsheet, and in this instance the phrases and quotes that underpin the open quotes were also recorded. This is shown in Table 2; a complete copy of this data is presented in the appendices. Some open codes reflect reactions to the questions themselves, or the overall process, however the built of these touch on actual strategy-related responses of the staff of the enterprise. Using a spreadsheet as an organizational tool allowed for easy traceability between quotes and open codes, which simplified both discussion and linkage tracking between interviews, quotes, and codes.

Several memos also originated from this first pass through the data; the memoing process is discussed in more detail in the section 5 of Chapter 4. Even given the well-educated community, the environment question required frequent clarification. Additionally, it became apparent that questions whose wording referred to prior questions generated frequent requests for clarification and repetition. More surprisingly, the questions like those touching on competition that were unusual to the context of an educational and non-profit entity, often generated thoughtful, diverse, and interesting responses.

#### **4.4.2 Axial Coding**

Once open codes had become consistence and stable, the data was taken into the second stage, axial coding. This phase is intended to identify repeated ideas, overall categories – in effect to “sense make” the bigger picture from the open code jigsaw pieces. The GTM allows for looping back to the the prior coding stages, in order to capture things not noticed or overlooked on the initial pass through the data. With the axial coding stage, instances of conceptual overlap and duplication were identified, and as understanding increases generally, some occasional return to the open coding also accommodated the need to correct occasional clerical and labeling oversights. From the data, five major categories emerged. These, categories, generally reflected the subject enterprise’s own strategic document used and discussed in [57].

The other groupings were readily apparent upon review of the data. The *stakeholders*, who fall within subgroups defining an individual’s context for certain services and providing an indicator of sophistication, are the ultimate individuals with expectations with respect to the library. The library’s own staff are concurrently users and providers of the services, as are those who oversee the structure of which it is a part. The students are, in some cases involving education and training related services, are themselves end result of the service provided as well as stakeholders, for example.

A table, built around a 25 item subset of data, showing progress from raw quote to reduced excerpt to open code to axial coding is shown as Table 2. The table demonstrates traceability from original interview inputs to ultimate strategic story results, illustrating the grounding of the final artifacts in the data. The axial coding was performed from the full version of this table, included in the appendices. The codes grouped under the *assessment and metrics* axial code, which include the various statistics collected and reported, are keys to the library being able to discuss and demonstrate. This category also capture, with granularity, the roles, functions, and services provided by the enterprise and notes the measures used to compare the enterprise against peers. It was necessary to ensure that application of an axial code like *models/practices/assessment* received careful scrutiny; if misused or overused it is possible for it to become a kind of catchall/miscellaneous grouping, which impedes the generation of a full understanding. In this instance, it is strictly used as a to collect the measures and reporting and scoring – something critical to the operating of this services based enterprise.

One set of open codes helps illustrates the sifting and comprehension process that accompanies open coding, the “larger goals” category. The *larger goals* of the library are defined both by things external to the parent institution and by interactions with the other institutional components. The codes grouped under this axial code are somewhat more loosely connected, and the linkage is perhaps less clear cut than other groups. This in some cases reflects opinions of subjects and the nature of institution. Ultimately, the goals are there, regardless of source or precise hierarchy, and represent the more abstract drivers for the library.

As it emerged from the data, it was clear that some goals were generally intra-institutional, applicable to how the inside-university stakeholders want activities carried out, and a more general grouping that derives from impact to the customers. The other collected codes fit into the more usual group and hierarchy configuration.

As an additional step, input from someone with expertise in and prior experience with applying GTM method in a software engineering context was solicited. This scrutiny resulted in some changes, largely in the interests of greater clarity of language, to the top-level headers; for example “*scoring*” became “*assessment/metrics*”. This step also functioned as a basic validation on the execution of GTM. Other modifications included using “*service quality, models, practices*” as a replacement for the initial, more casual term “*backoffice*” as a header/group label. With this information and revisions in hand, it became possible to view data in several additional formats, including Euler style circle diagrams<sup>1</sup> that function as category cluster diagrams, as in Figure 6.

Figure 6: Example Euler Diagram - Service Quality/Models/Practices

<sup>1</sup> A complete set of the artifacts created can be found in the Appendices.

#### **4.4.3 Selective Coding**

Selective coding requires selecting, from the concepts and categories resulting from the axial coding stage, one code to be the core category. Once this is chosen, the relationships of the others to it are defined. In this instance, the core is the “*provided service*” concept. This addresses specifically which service(s) are provided by the library and in what ways and for whom provision is made. This became the central concept because it is apparent that all other activities either define or help close the loop on decisions made and implemented on this concept. This concept, after intensive study of the open and axial codes, emerged from the data as the principle activity. Services - how to provide, measure, and report them, and at what level – is what the data defines as the ultimate product of the library and its ongoing decision loop. The larger goals of the library are defined both internally and by interactions with the parent institution and its components, and inform the service provision decision making.

#### **4.5 Memos and Memoing**

In GTM, a memo is used by the researcher to reflect what they have learned from the data; these contain the traces of concepts and their relationships as they are written by the investigator [28]. These artifacts evolve through the progression of the research process and become part of the researcher’s documentation and working notes during the process.

With this data set, several memos provide some insight into the overall execution and process, and open up discussion points for future investigation. For the stakeholders, the full discussion, not a single or subset of the VMOST based questions led to their identification. Additionally, from the overall data set, it was apparent that a high level of customer consideration was already, which helped in a generating particularly rich results and thorough coverage. The data, generally, supports a conclusion that there is little to no need to create or modify questions for this idea. Another memo is used to collect a small

set of “stray” pieces of data, that didn’t clearly fit into one axial code or category, but where nonetheless interesting and potentially useful. Memoing provides a useful way to manage these, allowing for easy consideration later on in the process. These notes also provide side considerations that might require clarification, for which GTM doesn’t explicitly provide a separate stage.

#### **4.6 Shaping Hypotheses Stage**

In both a theory development case study and an application of the GTM, one objective is to discover theories that are grounded in the data. In this research, the initial review of the coded data has led to several preliminary conclusions. The initial review of the data demonstrated remarkable coverage of the target EA framework (in this case the Zachman Framework [78]), indicating a general validity to the initial concepts behind the study [57]. Additionally, after the first set of interviews was conducted an opportunity for additional data collection presented itself. The enterprise under consideration had been conducting an internal strategy capture exercise in response to an institution-wide effort, and the concluding document was finished and made available. This allowed a comparison to be made between the library’s internal efforts and the research results [58].

The results of this comparison indicated an improvement in areas of coverage for the VMOST methodology, even though incomplete, versus the more conventional exercise conducted by the library. This sequence of results also tracked with the overlap between collection and analysis, observed by Eisenhardt in several studies [24], and permitted some perspective on the overall responses, and increased the awareness of the investigative staff to the additional contexts associated with a number of specialist terms and constructs.

After these two rounds of analysis with the initial data, a full application of the GTM was conducted once the complete data was available. The results of the coding and review resulted in a number of artefacts and perceptions. A sample of one of these

artefacts is shown in Figure 6, demonstrating the identification of groups and concepts. Code 2 (“students, faculty”) from the first row in Table 2, referring to the different types of customer is, for example, reflected in the classifications being presented as part of the larger group “*stakeholders*”). Similarly, row 3’s code 2, “scoring” finds a home – along with a wide variety of other metrics and tracking related concepts – under “*assessment/metrics*”. Several of these artefacts were delivered to the institution’s liaison to the project team, who responded positively to the overall understanding and modelling they represented.

As expected, several syntax and phrasing issues in the VMOST queries were identified, along with several general considerations for application of this process. Enhancements and modifications to the original VMOST questions are currently being considered for adaptation specifically in an EA context. Also, the coverage of the Zachman framework, while generally good for the relatively low time and effort impact on the subjects, could be improved by relatively brief additions to the VMOST questions. These additional VMOST questions were drafted, and further interview sessions were conducted with a subset of the original members of the staff of the enterprise. This additional result set shows promise for even higher coverage levels of the framework and overall interest as a future departure point for deeper investigation.

#### **4.7 The Story**

With the hypotheses, driven by the data, that the provided services are what define the library to stakeholders and to itself, and that various concepts, hierarchies, and activities - *service quality/models/practices, stakeholders, assessment/metrics, larger goals* – inform and shape these activities, it is necessary with the GTM as a qualitative method to provide a “story” to elaborate and expose the linkages found among the data. To provide an articulation for the idea, as an example in this instance, that the stakeholder is both customer and, sometimes, product both of library and of larger institution is

necessary for those not engaged in the coding to be able to follow the view thus developed.

To accompany the explanation of this “story,” typically delivered informally, and to demonstrate the interconnections among the high level axial codes, labels, lines and arrows were overlain on the composite diagram of the circles to create Figure 7, which doubles as an alternate view of the tree representation, two ways to view ultimate construct. All of these artifacts and the conversations they generated serve as an indirect ratification of the integrity of the explanations and view developed from the data. In this case study, some informal conversations served as a checking tool; the interest of the staffers in copies of these artifacts, and general agreement with the perspective developed, serve as confirmation of the basic integrity of these evolved concepts.

Subset of Coding Results, in Tree Format

#### 4.8 Shaping Hypotheses

In both a theory development case study and an application of the GTM, one objective is to discover theories that are grounded in the data. In this research, the initial review of the coded qualitative data has led to several preliminary conclusions. The initial review of the data demonstrated remarkable coverage of the target EA framework (in our case the Zachman Framework [78]), indicating a general validity to the initial concepts behind the study [57]. Additionally, after the first set of interviews was conducted an opportunity for additional data collection presented itself. The organization under consideration had been conducting an internal strategy capture exercise in response to an institution-wide effort, and the concluding document was finished and made available. This allowed a comparison to be made between the library's internal efforts and the research results [58].

The results of this comparison indicated an improvement in areas of coverage for the VMOST methodology, even though incomplete, versus the more conventional exercise conducted by the library. This sequence of results also tracked with the overlap between collection and analysis, observed by Eisenhardt in several studies [24], and permitted some perspective on the overall responses, and increased the awareness of the investigative staff to the additional contexts associated with a number of specialist terms and constructs.

After these two rounds of analysis with the initial data, a full application of the GTM was conducted once the complete data was available. The results of the coding and review resulted in a number of artefacts and perceptions. A sample of one of these artefacts is shown in Figure 8, demonstrating the identification of groups and concepts. Code 2 ("students, faculty") from the first row in Table 2, referring to the different types of customer is, for example, reflected in the classifications being presented as part of the larger group "stakeholders"). Similarly, row 3's code 2, "scoring" finds a home – along with a wide variety of other metrics and tracking related concepts – under

“*assessment/metrics*”. Several of these artefacts were delivered to the institution’s liaison to the project team, who responded positively to the overall understanding and modelling they represented. As expected, several syntax and phrasing issues in the VMOST queries were identified, along with several general considerations for application of this process. Enhancements and modifications to the original VMOST questions are currently being considered for adaptation specifically in an EA context. Also, the coverage of the Zachman framework, while generally good for the relatively low time and effort impact on the subjects, could be improved by relatively brief additions to the VMOST questions. These additional VMOST questions were drafted, and further interview sessions were conducted with a subset of the original members of the staff of the enterprise. This additional result set shows promise for even higher coverage levels of the framework and overall interest as a future departure point for deeper investigation.

#### **4.9 Enfolding Literature**

The Eisenhardt strategy for case study execution allows for consideration of “enfolding literature” – data text and artefacts that inform the understanding of the research team [24]. In a commercial, governmental or other structured entity, these will often include various external and internal documents. This sort of input can include organizational charts, process diagrams and asset inventories, for example, as well as regulatory and oversight data.

The enterprise in this study participates in several larger institutional constructs and possesses a well-defined internal structure. Consideration of various governing, strategic and planning materials related to these larger and complex entities could prove relevant as feedstock for theory and context capture. This investigation and research, as a part of the longer-term project, is still underway. Successful evaluation and identification of these items, if any, may prove useful for other entities, in terms of determining either inputs into an EA process or overall consideration of questions of operational control,

scope, stakeholder expectations and general accountability. This also embraces the GTM concept of sensitization [7], which provides direction for investigation and comprehension. This provides assistance in instances of differing professional and practitioner terminologies, guides to structures, and “inform the overall research problem” [13].

With this research, the unfolding literature is not particularly elaborate. Primary informational items for the research problem included the staff directory, organizational chart, and some minimal reference material regarding the interpretation of particular positions and titles provided by several of the staff. This information was used to ensure overall coverage of the internal divisions and components, and to ensure a wide spectrum of ranks and responsibilities was solicited. Potential additions, ultimately not employed for this investigation, could include various inputs and documents from outside entities, stakeholders, and professional or practice documentation. The interview data set, since the interviewer was seen as a nonspecialist, effectively negates any need for this information as the participants largely, through their comments, provided adequate reference or summary of potential points of interest.

#### **4.10 Examination and Initial Conclusions**

Following the GTM-based analysis of the case study qualitative data, and consideration of the data in the context of EA, it became apparent that while the overall collection of information was compelling it would be possible to increase coverage of the Zachman Framework with a minimal increase in effort required by adding additional questions. These would be directed at the areas of the Framework covered only slightly or indirectly by the results from the GTM processed interviews. For this new set of interviews, a subset of the original participants would be selected for a second interview, and the overall fieldwork and qualitative data treatment processes would be repeated.

#### **4.10.1 Better Coverage Desired**

To the initial ten questions, two new queries were added with the aim of increasing coverage of the “when” and “what” columns with the Zachman Framework. While some data for these Zachman columns was collected incidentally, anecdotally, or as a derivative of the original interview responses, it was evident that the data for these areas was lacking, and that a more thorough coverage would be better for sparking discussion and communicating context for EA construction. The first new question, “What are the key assets and resources of the organization?”, was crafted for to spark collection spanning material lists, models, and data (“What”). The second interrogative, “which of those assets do you use as a matter of routine - daily or weekly? What do you use quarterly, or otherwise routinely but less commonly?”, was intended to elicit “when” information like schedules and routines to better populate areas like event lists, details, and specification, many of which are critical for identification of reporting and automation aspects of an enterprise.

These two questions would be posed to thirty percent of the original participants, who were selected from the initial participant group based on their role and position within the overall enterprise, so as to retain coverage of the various institutional divisions. The same closed interview format and approach was reused from the initial interviews, and the additional qualitative responses would be processed with the GTM. The data and resulting coding were appended to the original results and are included in the full set of information in the appendices as a part of the processed interview and coding tables.

#### **4.10.2 Second Question Set Results**

While the elicited responses to the new questions were less verbose or intricate than the more abstract original questions, the responses still appeared thorough and useful for EA population. Additionally, the questions remain general purpose, and are not industry or profession specific even with this addition, and the total additional time taken

for each session was typically between five and fifteen minutes, which would allow for an interview of just over a half hour when combined with the original question set.

The difficulties in scheduling one individual to complete the investigation necessitated one deviation from the process; the questions were submitted and responses collected via email. This minor exception to the in-person process afforded a useful collateral point for consideration, namely that, once a relationship with the subject was in place, alternative forms of communication did not impede data collection. While not necessarily a fully tested conclusion, the essential similarity of depth and consideration provided by the responses elicited provide an interesting starting point for future research and investigation.

#### **4.10.3 A “Zero” Question**

Following a period of consideration of the full data set, overall theory based on the responses would indicate one additional question would be a good addition to the process. Beginning the interviews either by asking “What is the organization? How would you define the environment of the organization?” or by offering up a definition for this would seem useful for focusing the discussion slightly. Participants, given the questions that include terms like environment and competitor, often were uncertain how this could be considered without clarification or directly requested it from the interviewer.

- (0) What is the organization? How would you define the environment of the organization?
- (1) What is the vision of the organization? That is, what is the overall, ideal, end-state toward which the organization strives?
- (2) What is the primary activity that the organization performs to achieve that end state? What is the organization's mission?
- (3) How are the mission and vision appropriate and relevant to the environment, as you defined it?
- (4) Are the institutional mission and vision explicit or implied? How?
- (5) What are the institution's basic activities? How are those performed to allow the institution to be competitive with industry rivals? What industry do you think this institution is in, and what rivals does it have?
- (6) What goals has the organization set, and does it set goals? How does the organization determine if those goals are successful against competition?
- (7) What activities does the organization perform to achieve those goals?
- (8) How do the goals support the vision?
- (9) What metrics or scores are kept? Are they linked to objectives? Are the objectives linked to goals? What if anything is done to achieve those objectives?
- (10) How are the objectives identified earlier tied to goals?
- (11) What are the key assets and resources of the organization?
- (12) Which of those assets do you use as a matter of routine - daily or weekly? What do you use quarterly or otherwise routinely?

**Figure 9: Revised, Extended VMOST Queries**

#### **4.11 Summary**

This research and the elicited results indicate that the adapted questions, while powerful elicitation tools, might benefit from minor adjustments in language for clarity, one additional point for initial context, and two additional questions for EA coverage should they be employed as a initial elicitation mechanism. The complete set, with lightly adjusted language for use in an interview format and including the suggested context and additional new queries, is shown in Figure 9.

This set of elicitation questions successfully elicited data for all Zachman's columns, and provided data for input for many of the blocks. The elicited data shows an enterprise aware of an evolving set of roles, a rich set of services, and a need to be cost and infrastructure aware particularly with IS/IT resources. Overall, this strategic capture has acquired both a solid sense of the library's role and has elicited the type of information that could prevent costly rework – exactly the goal of the creators of the

original EA concepts. By encouraging engagement and understanding, subsequent software decisions will be made with an eye to the needs and goals both short and long term of the library.

While both rationale for the modifications and potential utility of the reuse of the questions can be reasonably taken from the grounding in the data, some further discussion and elaboration is required. Additionally, an acknowledgement of the limitations of the tools and the overall process is a requisite for proper use of this technique, in part so that those good decisions can be made after this exercise. A treatment of these questions follows in the next chapter.

## **Chapter Five – Discussion and Limitations**

The modified questions, laid out at the close of the preceding chapter, form a part of the initial conclusions of this work. These questions provide a partial fulfillment of the overall goals laid out in Chapter 1 of this dissertation. As initial results, they stem from the application of a variety of tools and processes, including a lightweight approach to enterprise architecture (EA) elicitation employed within a real, representative enterprise, in the scaffolding of an executed case study as discussed in the third and fourth chapters. The Vision-Mission-Objectives-Strategy-Tactics (VMOST) technique, as adapted by Bleistein et al. [3][4][5], was used, and the Grounded Theory Method (GTM) was employed to analyze the qualitative data elicited by the VMOST strategy elicitation technique, as discussed in Chapter 2.

This combination of techniques allows for generalization but requires acknowledgement of potential limitations of both the individual techniques and the overall chain, so that this research can be considered safely and appropriately. This chapter presents the set of generalizations, grounded in both the qualitative data and a variety of trends found within the results, as well as considerations regarding the processes and limitations employed both singly and as a complete set.

### **5.1 Validity Concerns**

As this research required a variety of tools and data collection techniques, is based on qualitative responses, and derives a variety of conclusions from intensive examination of data, an assessment of the risk factors for use of these conclusions is in order, to consider overall validity as defined for the case studies [38]. These risks can be viewed as as a threat to the internal validity, which is concerned with the overall quality and process of both data collection and subsequent analysis. The data collection mechanisms, the responses, and even the questions asked, for example, pose risks to the overall

connections and integrity of the data, which are all considered internal risks for the specific linkage and summation of the data. Risks are also present to the external validity, which can impact the extent to which the conclusions can be taken as general or extrapolated for other uses, particularly as the conclusions are taken from specific enterprise which may or may not have features or attributes unique to its general category or specific staff, arrangements or practices.

### **5.1.1 Internal Concerns and Considerations**

Internal threats to the outcomes are those that are based within the data and study itself, threats that jeopardize the integrity of the conclusions or analysis. In this case, the case study approach [24][75][76] has been shown an effective arrangement for handling numerous considerations in studies of this type, including variability and overall research approach, as well as providing overall structure. This can be said with some confidence since, when using the Zachman Framework [77][78] as a measure, execution of the initial interview round alone produced inputs for all but one of the columns, when the responses to the two additional questions were used, the “When” column (see Figure 1) had input data as well. While informal, there is agreement from staff members from the studied enterprise that the diagrammatic artefacts, shown in Chapter 4, derived from the GTM-coded data do correctly present a working understanding of the institution also affords an attestation of the validity of the results.

As with any experiential research, the nature of a case study makes it is necessary to consider to the limitations of the data and process. As this particular research study ultimately generated requirements engineering artifacts in the form of qualitative data, and in using the GTM [65] applied a qualitative analytic technique, there are potential risks of subjectivity present. There are also the customary challenges of results replication where working institutions are concerned. For example, the roles of some personnel interviewed have evolved over the time of the project. In addition, having

“been studied,” the researcher is unlikely to get the same response to the same question, if only because the subject has had an opportunity to think about their initial response. Potential Hawthorne Effect issues, where social effects including a desire to please interviewer or management impact answers, must also be considered [39], but are unlikely to be a significant risk as the collection of data, vice specific responses, being a goal. While the specific responses could potentially impact any EA drawn up from this data, the consideration remains for any event seen to have feedback to management; as this study was conducted under parameters that anonymized individuals.

Additionally, for this research, the staff of the enterprise were already engaged in strategic thinking during part of the effort [57] which may have been a positive and negative for this exercise. While the subjects may have been already focused and have considered the larger picture, this may have led to repetition of prior answers or otherwise limited their answers to those from prior thoughts or discussions which could have unintentionally constrained the data elicited and collected. Countering this risk is the potential benefits to the fluency and articulation of the responses, and the possibilities of additional broadness in response due to the activities associated with the institutional effort. It is difficult to point, save in one or two very isolated moments, to any specific realization of these consideration but there is a possibility of impact both conscious and unconscious, which should be noted.

The overlay of a subset of the GTM with the case study method, as a combination of techniques, also raises points to consider. As processes sharing a goal of full comprehension and theory development plus having considerable construction and, in some instances, terminology similarities the use of the GTM coding concepts as an overlay to the case study method to accommodate qualitative data worked well. Some additional care in the discussion and application of the one within the framework of the other was necessary, but could be accomplished with the awareness of the need for that precision in place. When the combination is informed by the employment of an EAF as a

target destination, the results are reinforced by the scaffolding created by the specifics of an operational objective and context.

### **5.1.2 External Concerns and Considerations**

External threats to the conclusions are concerned with the reuse of conclusions and extension and extrapolation of any patterns or effects seen in the course of a study, particularly those that, like this research, is burdened with the complexities of human subjects, qualitative analysis, and working environments. In this specific instance, use of the GTM imposes certain restrictions on how generalized any set of conclusions can be, as use of this method leads to conclusions that are rooted in the data as received from the subjects. While anomalous responses can be mitigated by drawing a wide net across an institution, any reflection of institutional life whether accurate or inaccurate that are widely shared are likely to be perpetuated either as underlying assumption or a central tenet in the elicited data. In this instance, the basic structure of the institution and the fact it has numerous and generally similar peers provides greater confidence in the general conclusions reached.

The case study method potentially obscures, by centering on one enterprise as the studied institution, both general conclusions and considerations unique to the studied enterprise. In this case, the studied enterprise is an example of a community of institutions with a long history of self study and continuous reform and improvement [35], informed by a large body of professional literature [20][21][42][43][44][79]. For example, these considerations could have led to artificially high data collection outcomes, especially given the preference for openness and assistance that defines usual behavior for an institution of this type.

Given the origination of the research project as a reaction to possible barriers to adoption of EA, it is worth noting that the particular analytic method applied could itself be a hurdle for an enterprise embracing the precise approach discussed in this work to

date. While it is possible that the GTM could be taken up by this specific enterprise without outside personnel, given the background and levels of education and expertise represented, the method could prove impractical for some possible users. Further investigation and evaluation of other approaches and options to achieve similar ends certainly merit investigation. The flexibility of the combination of GTM and the VMOST elicitation mechanism, in particular, offers interesting possibilities for further study.

Lastly, the application of the lightweight EA elicitation mechanism proposed in this work has garnered a remarkable body of data, represented in the appendices, at cost to the institution that, so far, has proven to be an acceptable additional burden – less than a dozen hours of interview time. While this implementation is unlikely to scale to large institutions, other approaches for high headcount institutions are already present within the existing, heavyweight EA frameworks. The application of the combination of tools employed has been within acceptable scope of effort, and has created what appears to be a high level of overall comprehension regarding institutional objectives, context and goals.

## **5.2 Elicitation Process Results**

The adaptation of VMOST created by Bleistein et al. [3][4][5] proved remarkably effective at going well beyond the business strategy areas for which it was designed [57][58]. Some caution in extrapolating this utility for other purposes is merited as the tool was not designed as an all-inclusive elicitation mechanism. While this resulting is promising, caution is merited in predicting similar data coverage in all situations. This stakeholder community is, largely compromised of academic professionals disposed by professional training and day-to-day role to be helpful and quick to provide data. Further study would be required before the success in this instance, at least in terms of data collection, could be termed indicative of a fully elaborated process for success with EA data collection. The startling collection of data, included as appendices, includes much

detail and information outside scope of the business strategy arena these questions were created to map would also justify further examination of the success of these queries is also merited, if only to determine if this success was anomalous.

### **5.3 Summary**

The lightweight EA elicitation approach proposed and evaluated here, with these caveats, could be reused by another, similarly professionally-staffed institution. No limitations in this study have surfaced that would prohibit a comparable academic, non-profit, or governmental institution from successfully using as a guide the approach demonstrated by this case study. This study helps open the way for such an institution to apply EA and, thus, improve its IT management. In providing a pattern, this work constitutes a contribution to the technical materials inventory available to practitioners.

The application of the VMOST questions [64] as a mechanism for EA elicitation and the utilization of the GTM [65] sensemaking of the qualitative data shows promise for enabling alignment of the information technology (IT) / information systems (IS) portfolio with a variety of goals, as well as providing a route to improved understanding and governance of institutional goals. The large set of data VMOST elicited illustrates the power of this simple tool to collect an impressive amount of data; by allowing for open answers and asking general questions, this technique proved effective, possibly because it is not directly derived or based in the EA structure but more concerned with understanding and data collection. This indirect approach may, itself, be a technique that can be generalized for other needs. The elicitative, discussion nature of the questions also encouraged engagement with the interviewer, and probably helped offset any Hawthorne tendencies. The face-to-face approach also appeared to facilitate creating channels of discussion and opening conversation with the “outsider” visiting researcher/interviewer.

## **Chapter Six – Conclusions**

In Chapter 1, a variety of considerations and concerns regarding the application of Enterprise Architecture (EA) were presented, including a central question regarding the application of a lightweight approach to the elicitation of strategic and institutional data and creation of alignment between objectives and assets in the Information Technology (IT) / Information Systems (IS) portfolio, as articulated in both the Introduction and Chapter 2. Chapter 3 provides a construction plan for a case study which was employed and underpins Chapter 4's execution which incorporates the use of the Grounded Theory Method. This study, and its limitations, is, in turn, brought under rigorous examination in the fifth chapter, which probes both the overall evaluation of the data and the procedural chain created to underpin this dissertation.

This chapter closes this dissertation and provides a discussion of the fulfillment of the overall research objectives and the entirety of the project it entailed. It also discusses a number of publications have been contributed and a number of future avenues for further investigation show promise as well. It also provides some final reflections on the motivations and applications of this research.

### **6.1 Research Enquiries**

Chapter 3 of this dissertation provides an illustration of a qualitative data elicitation program for EA, and Chapter 4 lays out the execution of that plan. With the resulting efforts, a number of research questions were addressed, and the overall utility of this toolchain in a nonprofit, government and education context was demonstrated. The overall effort and research project has collected data that support a number of answers and conclusions successfully in spite of the variables inherent in working with a live, working community and their enterprise.

Collectively, the research questions posed in the Introduction and address below can in large part be addressed by the outcomes of this project:

- *Can a general lightweight elicitation, specifically Vision-Mission-Objectives-Strategy-Tactics, technique gather information suitable for conversion into enterprise vision and mission?*

The wealth and variety of information, collected as coded in the Appendices, provides information that well addresses the mission and vision of the studied enterprise. Every interview touches on concepts – “support research activities,” “support teaching,” “provide access”, “metropolitan university” – that would be points to consider and incorporate into vision and mission artifacts.

- *Does engaging in the elicitation provide data sufficient to begin populating an enterprise architecture framework?*

The elicitation, particularly when combined with the analytic methods, provided impressive inputs for filling the Zachman’s matrix. The results far exceeded the expectations, even before the advanced analyses was completed and were put before the research community even before the completion of the project.

- *Is qualitative analysis, specifically the Grounded Theory Method, effective and applicable in an EA context?*

The subset of the Grounded Theory Method employed was, in the view of consideration of an EA, more generally software engineering needs, a valuable and powerful tool for consideration of this information. It effectively enabled consideration of both whole interviews, the complete dataset, and the individual concepts that populated them.

- *How do results of Vision-Mission-Objectives-Strategy-Tactics map to an enterprise architecture framework?*

As discussed in regards to the first paper, mapping VMOST queries or responses specifically to an EAF, Zachman or otherwise, is not entirely applicable

particularly in the light of the overall comprehension of the data allowed by the qualitative analysis. While this particular construction of the question may have been overcome by the nature of the results and process, the more general idea that VMOST would do well with an EAF is within the scope of the outcomes.

- *Can we achieve understanding across a complex stakeholder environment?*

While accepting that understanding is a moving target, a solid overall picture can be achieved and, perhaps more importantly, working ground can be established for further work. The reaction to the artifacts, and the overall richness and common vocabulary created by the sequence used for this work and shown in the combination of data and artifacts, can be reasonably accepted as a

- *Which, if any, of the Enterprise Architecture-Capability Maturity Model scores improve if the Vision-Mission-Objectives-Strategy-Tactics, Grounded Theory Method, Zachman Framework chain is employed?*

By engaging in this exercise, the Capability Maturity Model score for this enterprise was improved if only by collating and demonstrating data and creating another artifact set for holistic institutional understanding. Through investigation of an EA, maturity was improved, moving from a 0 or 1 level (none, informal) to a 2 or 3 level (development, defined) on a variety of EA-CMM elements, including Architecture communication, development, and process, simply by the organization of the data for consideration and investigation necessary to consider the results of this study. Business linkage documentation and consideration may also have increased in score, but were somewhat outside the scope of the initial investigation and are harder to evaluate without deeper investigation into the initial state than permitted by the techniques employed.

As shown in the papers<sup>2</sup> VMOST elicitation did successfully provide vision and mission and populate an EAF. Additionally, the GTM did prove effective and applicable for qualitative analysis in an EA context, as illustrated by the sophistication of the various artifacts as passed back to the institution. The VMOST queries mapped generally, not specifically, to the needs of EAF as evidenced by the scale of the information collected in the appendices. All of the artifacts and analysis, taken collectively, demonstrate both the creation of significant understanding of and the overall complexity of the stakeholder and enterprise environment.

## 6.2 Contributions

This dissertation offers a roadmap for future practitioners' efforts to employ the proposed toolchain, this research also contributed three items to the professional literature corpus of computer science and information technology. These included [58]:

Rosasco, N., & Dehlinger, J. "Eliciting Business Architecture Information in Enterprise Architecture Frameworks Using VMOST." 2011. In *1<sup>st</sup> ACIS/JNU International Conference on Computers, Networks, Systems and Industrial Engineering*, pages 474–478, 2011.

This first publication, written with a partial set of data in hand from the initial interviews, illustrates the initial effectiveness of the Vision-Mission-Objectives-Strategies-Tactics (VMOST) [64] elicitation mechanism without the full Grounded Theory Method (GTM) [65] processing of the data. This work offers only an initial consideration of the data. This early appraisal of the results provides a demonstration of the overall utility of the interview technique; this success was presented at the 2011 International Association for Computer and Information Science (ACIS) Conference on Computers, Networks, Systems and Industrial Engineering after acceptance of the paper.

---

<sup>2</sup> See Section 6.2, Contributions, for specific references to each paper.

 VMOST 1,6,7      VMOST 5

**Figure 10: Zachman Cells/VMOST Questions Initial Mapping, as presented**

This paper provided a somewhat limited presentation of the data garnered by the first interviews, which had not yet been considered with the coding stages subset of the GTM. It presented a simple mapping of the VMOST questions to Zachman cells, shown in Figure 10, was based on a rapid evaluation of the initial data without benefit of the insights provided by a full processing with three stage coding. The GTM coding for qualitative analysis provided insight of the limitations of this initial conclusion. These insights included a realization that consideration of both the individual interviews as whole documents and the full dataset, in addition to excerpts of the results, created a far more complete view and comprehension of the data. The GTM-based qualitative analysis steps, by requiring immersion in the data, rather than just single readings, significantly enhanced the utility and usability of the results. The richness and command of the dataset as elicited by VMOST and collected as interview transcripts was powerfully enhanced by the coding concepts taken from the GTM, and illustrates the power of the coding concept as described for GTM method. An illustration of this, mapping examples from the coding results to the Zachman cells, is provided as Figure 11.

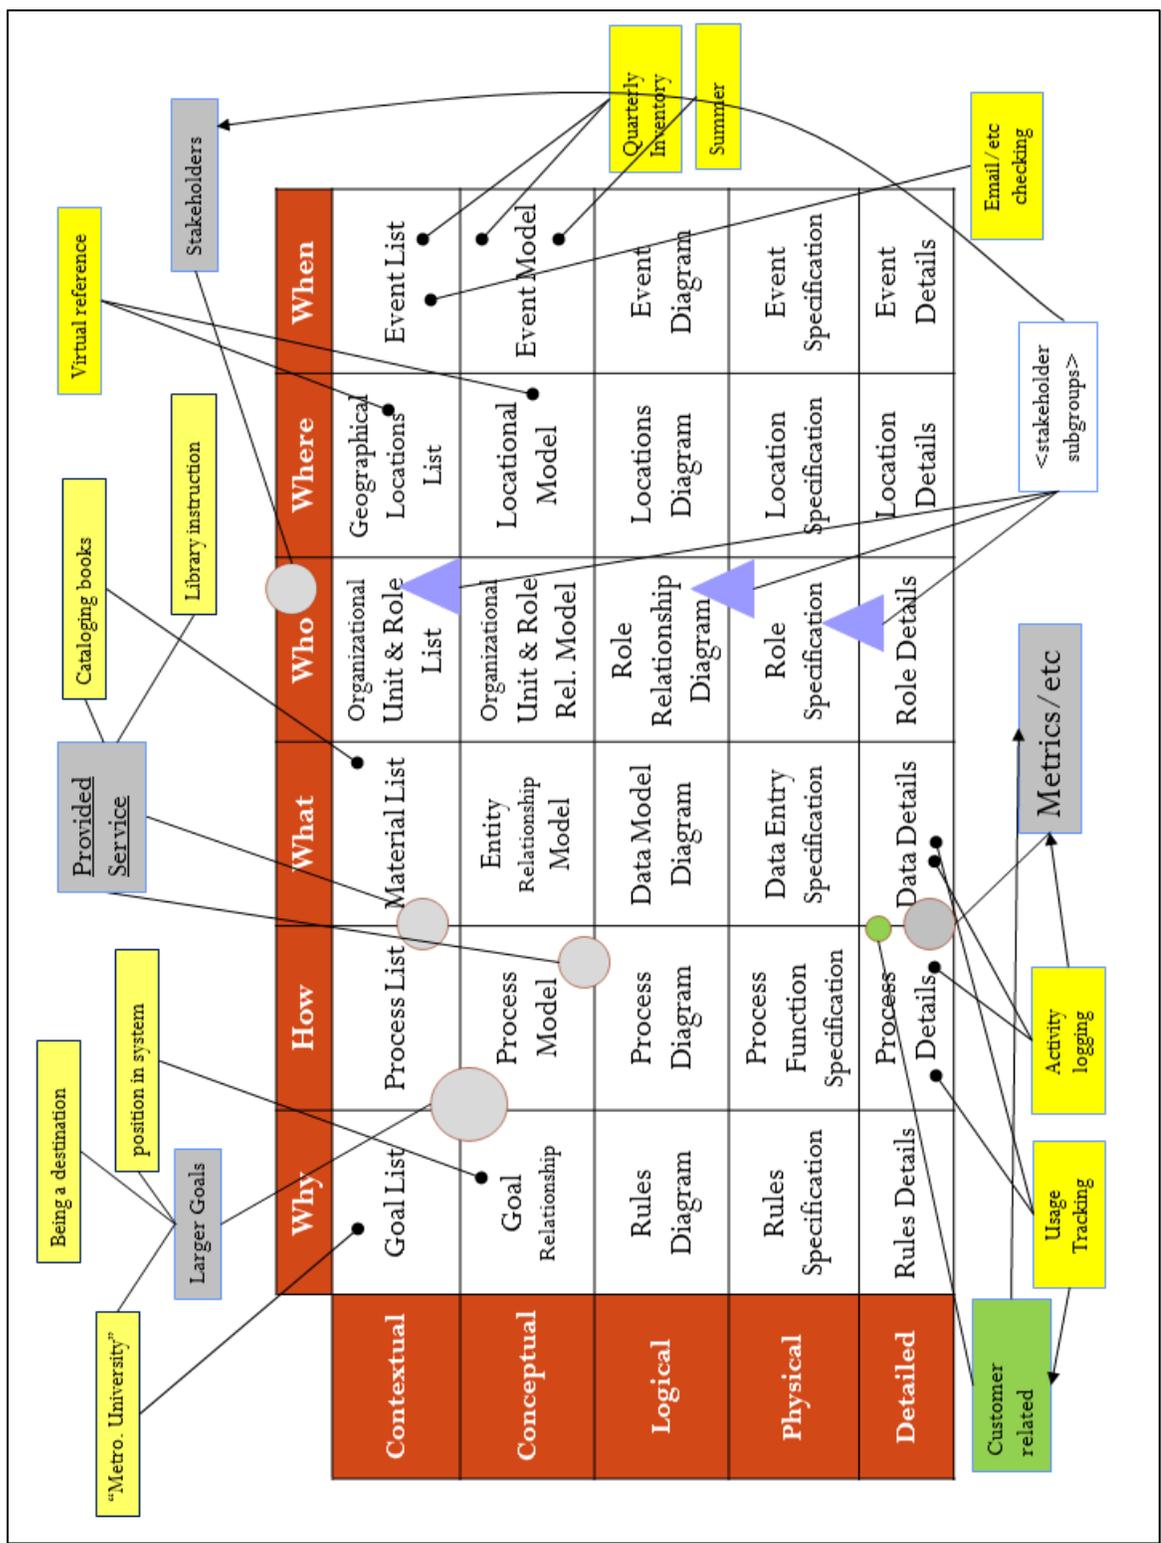

Figure 11: Example GTM Coding Results Mapped to Zachman Framework

Further results were presented in [57]:

Rosasco, N., & Dehlinger, J. “Business Architecture Elicitation for Enterprise Architecture: VMOST versus Conventional Strategy Capture.” In *SERA 2011 - Ninth International Conference on Software Engineering Research, Management and Applications*, pages 153–157, 2011.

The second contrasts this initial data set to the coverage created using an elicitation process for strategy employed internally by the enterprise itself, using Zachman Framework coverage as a comparison mechanism. The overall results of this paper posit that VMOST when joined to EA provides a powerful tool for overall data capture to better inform business strategy efforts. Finally, the overall methodology including GTM, VMOST, and the case study process, was presented in [56]:

Rosasco, N., & Dehlinger, J. “Application of a Lightweight Enterprise Architecture Elicitation Technique using a Case Study Approach.” In *ENASE 2014 - Ninth International Conference on Evaluation of Novel Approaches to Software Engineering*, 2014.

The third work elaborates on the case study approach and elaborates on the utility of GTM as a operational and comprehension tool for qualitative data, and describes many parameters and limitations of the efforts that underpin this dissertation. The principal thrust of this publication, presented at the Evaluation of Novel Approaches to Software Engineering (ENASE) conference in Lisbon, Portugal, discusses the overall methodology and process, as well as the data derived theory and the limitations that limit the generalizability of the conclusions.

### **6.3 Future Work**

Planned future work will include soliciting additional feedback on those constructed artefacts and assembly of the various stages into a fuller presentation of the process, to better assess their impact will be done. Further investigation of the capabilities and operational considerations for the application of this lightweight methodology are merited, to test the utility of the approach with other enterprises and institutional

contexts. The utility of this process and EA generally for prioritization of security needs, meeting the challenges of complex system integration also merit investigation. This approach and technique chain may afford a middle path between “heavy” and “lightweight” techniques for overall enterprise decision making, especially given the modern trend towards mashups and high flexibility environments. Operations and informed decision making given the evolution of social media platforms and service-oriented architecture (SOA) needs also could benefit from the approaches discussed, as EA informs overall change and process management and contextualization. Additionally, a publication targeted at the library specialist professional community, laying out the strategic understanding advantages and overall rationale for building an EA, already in preparation, will follow this dissertation.

#### **6.4 Summary**

As addressed in the first section of this chapter, the questions posed for this research in Chapter 1 are effectively addressed by this dissertation. The use of a general lightweight elicitation technique used does, in answer to a primary investigative query, provide information suitable for conversion into an enterprise vision and mission. As addressed earlier in the first section The VMOST elicitation technique, as adapted by Bleistein et al. [3][4][5], successfully gathered not only information to create a vision and mission statements, its application provided a broad spectrum of information. This information, in terms of coverage of the Zachman Framework as an enterprise architecture framework (EAF), went well beyond the expected data as discussed in [57] and [58]. The institutional maturity, when considered in the context of EA and Capability Maturity Model (CMM), was also enhanced through the conduct of this exercise, if only through the data collection and collation exercise. By moving to informal or developmental (levels 1 and 2, respectively), possibly even level 3 (defined), of EA-CMM in terms of architectural process, communication, and development. The business

linkage area may also have improved but are harder to evaluate; in all, an overall starting point for future EA efforts is demonstrated through achieved maturity [54]. It is reasonable to conclude that the strategy of applying lightweight guidance for the initial data elicitation and analysis of the artefacts necessary for an enterprise architecture (EA) plan has shown promise, and, with a locally-informed EA plan in hand, there appears to be a high likelihood of delivering the expected benefits of this area of practice including clear objectives and good requirements context information.

The use of the case study method has provided useful results for the exercise of the approaches being examined. The use of EA outside of the large institution and IT/IS specialist contexts has been demonstrated with a configuration that is not enterprise or institution-type specific. In addition, the GTM was shown to be applicable in the context of EA. Ultimately, it may need additional investigation and development to bring it fully into the toolkit of IS/IT practice, but successfully allowed for a full view and comprehension of a wide variety of qualitative data.

While the mapping of VMOST to the Zachman Framework is explored in [58], further investigation with a complete data set indicates that the elicitation is not as susceptible as originally thought to a straightforward question to cell mapping. The overall execution of the interviews and resulting dataset, instead, provide broad understanding and coverage when viewed through the lens of the GTM. Understanding of a complex stakeholder environment is achievable, but requires a commitment to deep consideration of data. The process of elicitation when structured as an interview proved to be a compelling mechanism; the essential interactivity created an environment of engagement and feedback that lent itself well to the sensemaking requirement.

In terms of the overall project questions, lightweight elicitation techniques have exceeded the initial expectations for collecting data to populate an EA framework (EAF), as exemplified by the easily identifiable information contained in the interview results even before processing. Additionally, the lightweight techniques have succeeded in

fulfilling the need for vision and mission capture, as demonstrated by the richness of the resulting summary artefacts. The need for a systematic approach to demonstrate overall comprehension and improved data collection has been met by the case study approach and the multiphase coding of the GTM.

**Appendix A: Human Subjects Related Documents**

*[Exemption Letter from Towson University Institutional Review Board for the Protection of Human Subjects]*

**EXEMPTION NUMBER: 11-0X14**

To: Nicholas S. Rosasco  
From: Institutional Review Board for the Protection of Human Subjects, Melissa Osborne Groves, Member  
Date: Thursday, September 02, 2010  
RE: Application for Approval of Research Involving the Use of Human Participants

Office of University  
Research Services  
  
Towson University  
8000 York Road  
Towson, MD 21252-0001  
  
t. 410 704-2236  
f. 410 704-4494

Thank you for submitting an application for approval of the research titled,  
*Mission and Requirements Definition for the Creation of an Enterprise  
Architecture for a University Library*

to the Institutional Review Board for the Protection of Human Participants (IRB) at Towson University.

Your research is exempt from general Human Participants requirements according to 45 CFR 46.101(b)(2). No further review of this project is required from year to year provided it does not deviate from the submitted research design.

If you substantially change your research project or your survey instrument, please notify the Board immediately.

We wish you every success in your research project.

*[Below is the text of the Exempt Research Cover Letter, as required by Towson University's Institutional Review Board for the Protection of Human Participants. ]*

August 1, 2010

Dear Participant,

My name is Nicholas S. Rosasco and I am a graduate student in the Information Technology program of the Department of Computer Science at Towson University. As part of the research for my doctoral dissertation, I will be conducting a series of interviews to gather information on the business processes and software engineering strategies used by college and university libraries. Participation in the interviews is voluntary. If you opt to participate, you will be asked to respond to a series of questions. It is not necessary to answer every question, and you may discontinue participation at any time. Your decision whether or not to participate in the project or to withdraw from the project at any time will in no way affect your employment status. Your supervisor has given me permission to conduct my study at your workplace.

If you have any questions about the project, you may contact me at (443) 306-8992, my faculty advisor, Dr. Josh Dehlinger at (410) 704-4536, or the Chairperson of Towson University's Institutional Review Board for the Protection of Human Participants, Dr. Debi Gartland, at (410) 704-2236. A copy of the collected responses can be sent to your Towson email address, along with background information on the software engineering assessment process, if you would like to see it upon completion.

*[Below is a copy of the form used during the interview session by the interviewer.]*

## CURRICULUM VITA

NAME: Nicholas Stephen Rosasco

PROGRAM OF STUDY: Information Technology

DEGREE AND DATE TO BE CONFERRED: Doctor of Science, 2014

Secondary Education: Broadneck High School, Arnold, MD, June, 1997

<u>Collegiate institutions attended</u>	<u>Dates</u>	<u>Degree</u>	<u>Date of degree</u>
University of Virginia	1997-2001	BS	January 2002
Loyola University Maryland	2003-2006	MS	May 2006
Towson University	2008-2014	DSc	July 2014

Professional publications:

Nicholas Rosasco, Dane Brown: Digital Freedom Fighting – An Interdisciplinary Science and Engineering Education Module. American Society for Engineering Education Zone 1 Conference, 2014.

Nicholas Rosasco, Josh Dehlinger: Evaluation of a Lightweight Enterprise Architecture Technique Using a Case Study Approach. ENASE 2014 - Ninth International Conference on Evaluation of Novel Approaches to Software Engineering, 2014.

Nicholas Rosasco, Josh Dehlinger: Business Architecture Elicitation for Enterprise Architecture: VMOST versus Conventional Strategy Capture. SERA 2011 - Ninth International Conference on Software Engineering Research, Management and Applications, 2011: 153-157.

Nicholas Rosasco, Josh Dehlinger: Eliciting Business Architecture Information in Enterprise Architecture Frameworks Using VMOST. First ACIS/JNU International Conference on Computers, Networks, Systems and Industrial Engineering, 2011: 474-478.

Nicholas Rosasco, David Larochelle: How and Why More Secure Technologies Succeed in Legacy Markets - Lessons from the Success of SSH. 2<sup>nd</sup> Annual Workshop on the Economics of Information Security, 2004: 247-254.

David Larochelle, Nicholas Rosasco: Towards a Model of the Costs of Security. University of Virginia Technical Report CS-2003-13, June 2003.

Positions held:

- 1994 Reference Department Staff, Nimitz Library,  
U. S. Naval Academy, Annapolis, MD.
- 1996 Software Developer, Department of Computer Science,  
U. S. Naval Academy, Annapolis, MD.
- 1998 Software Developer, ESSE Incorporated, Annapolis, MD.
- 2000-2001 Software Developer/Network System Security Technician,  
Information Technology Services Division  
U. S. Naval Academy, Annapolis, MD.
- 2003-2010 Software Engineer/Configuration Manager/System Administrator,  
L-3 Communications STRATIS/Titan Group,  
Annapolis Junction, MD.
- 2010-2012 Software Engineer/Configuration Manager/System Administrator,  
Praxis Engineering Technologies, Annapolis Junction, MD.
- 2012 Adjunct Instructor, Graduate Program in Computer Science,  
Loyola University Maryland, Baltimore, MD.
- 2013 Adjunct Professor, Department of Computer Science,  
U. S. Naval Academy, Annapolis, MD.
- 2013 Instructor, Summer STEM Program,  
U. S. Naval Academy, Annapolis, MD.
- 2014 Adjunct Professor, Dept. of Electrical and Computer Engineering,  
U. S. Naval Academy, Annapolis, MD.
- 2014 Assistant Professor, Department of Computer Science,  
Valparaiso University, Valparaiso, IN.

Professional Memberships:

American Library Association  
 Association for Computing Machinery  
 Association of College and Research Libraries  
 Institute for Electrical and Electronics Engineers  
 IEEE Computer Society  
 Library and Information Technology Association
