

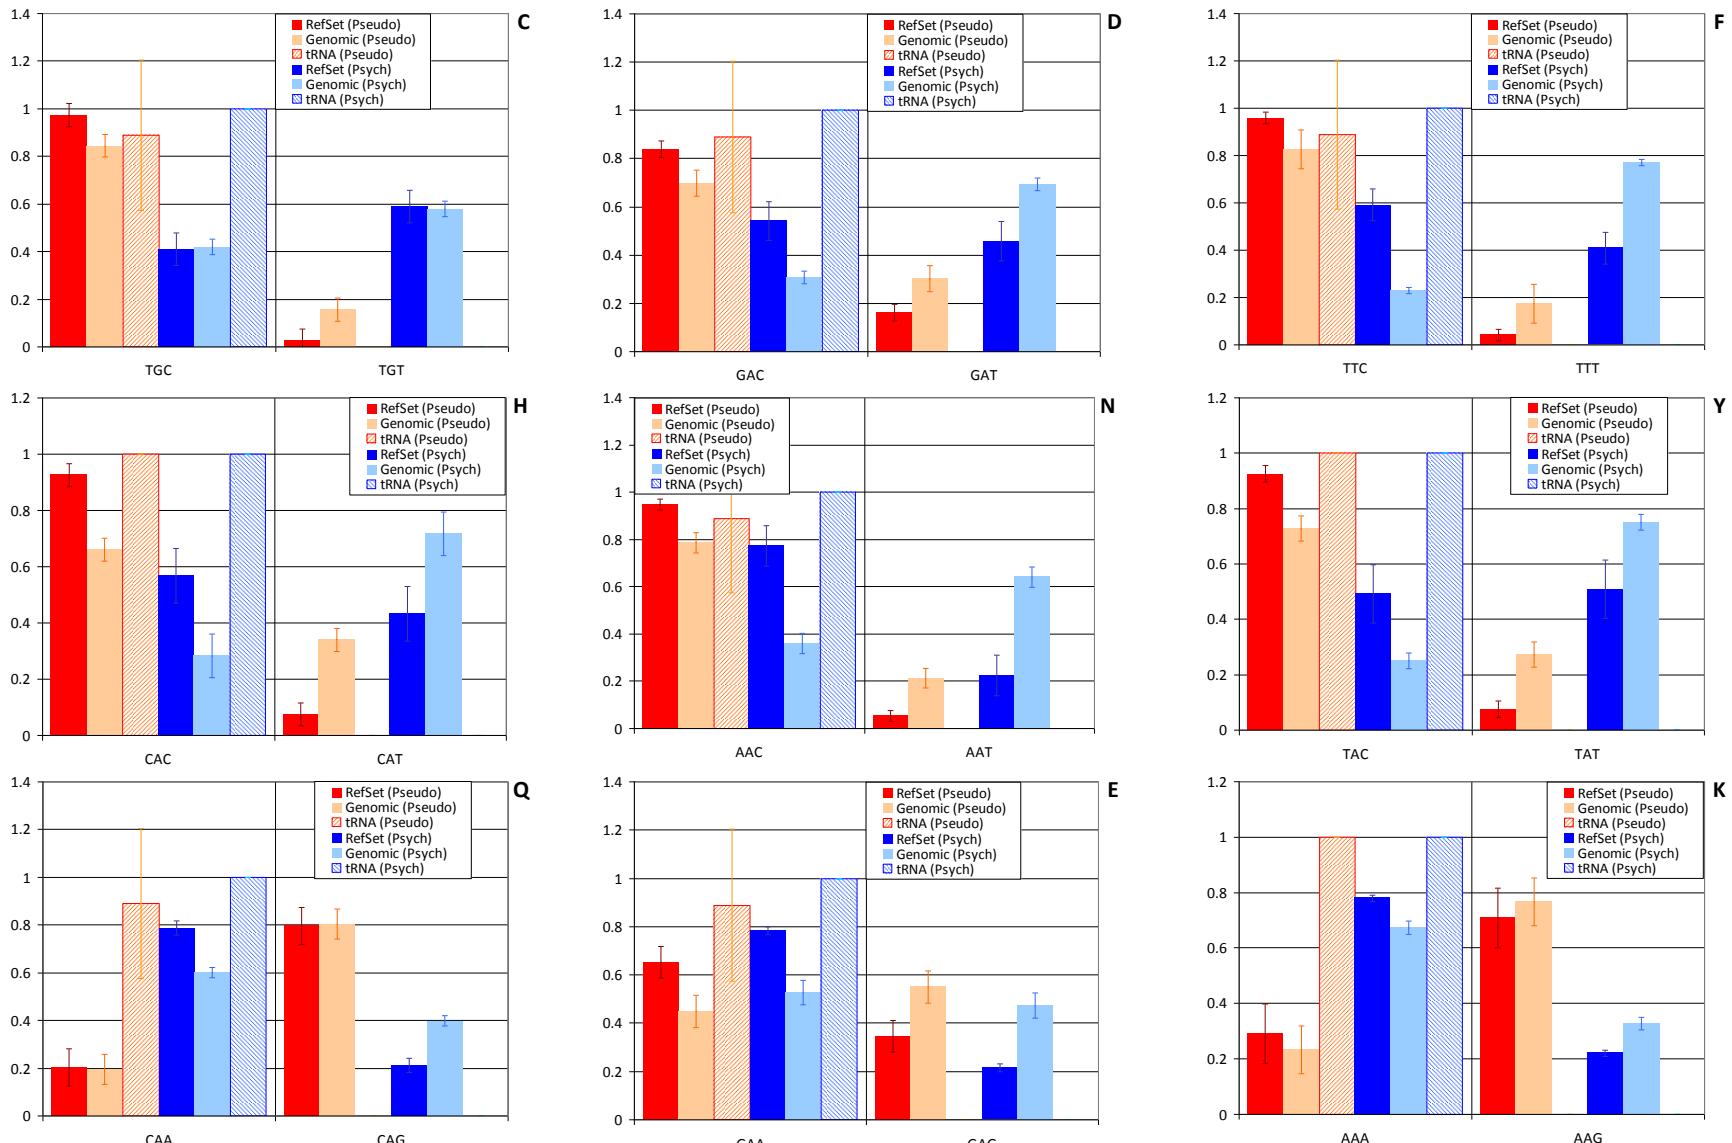

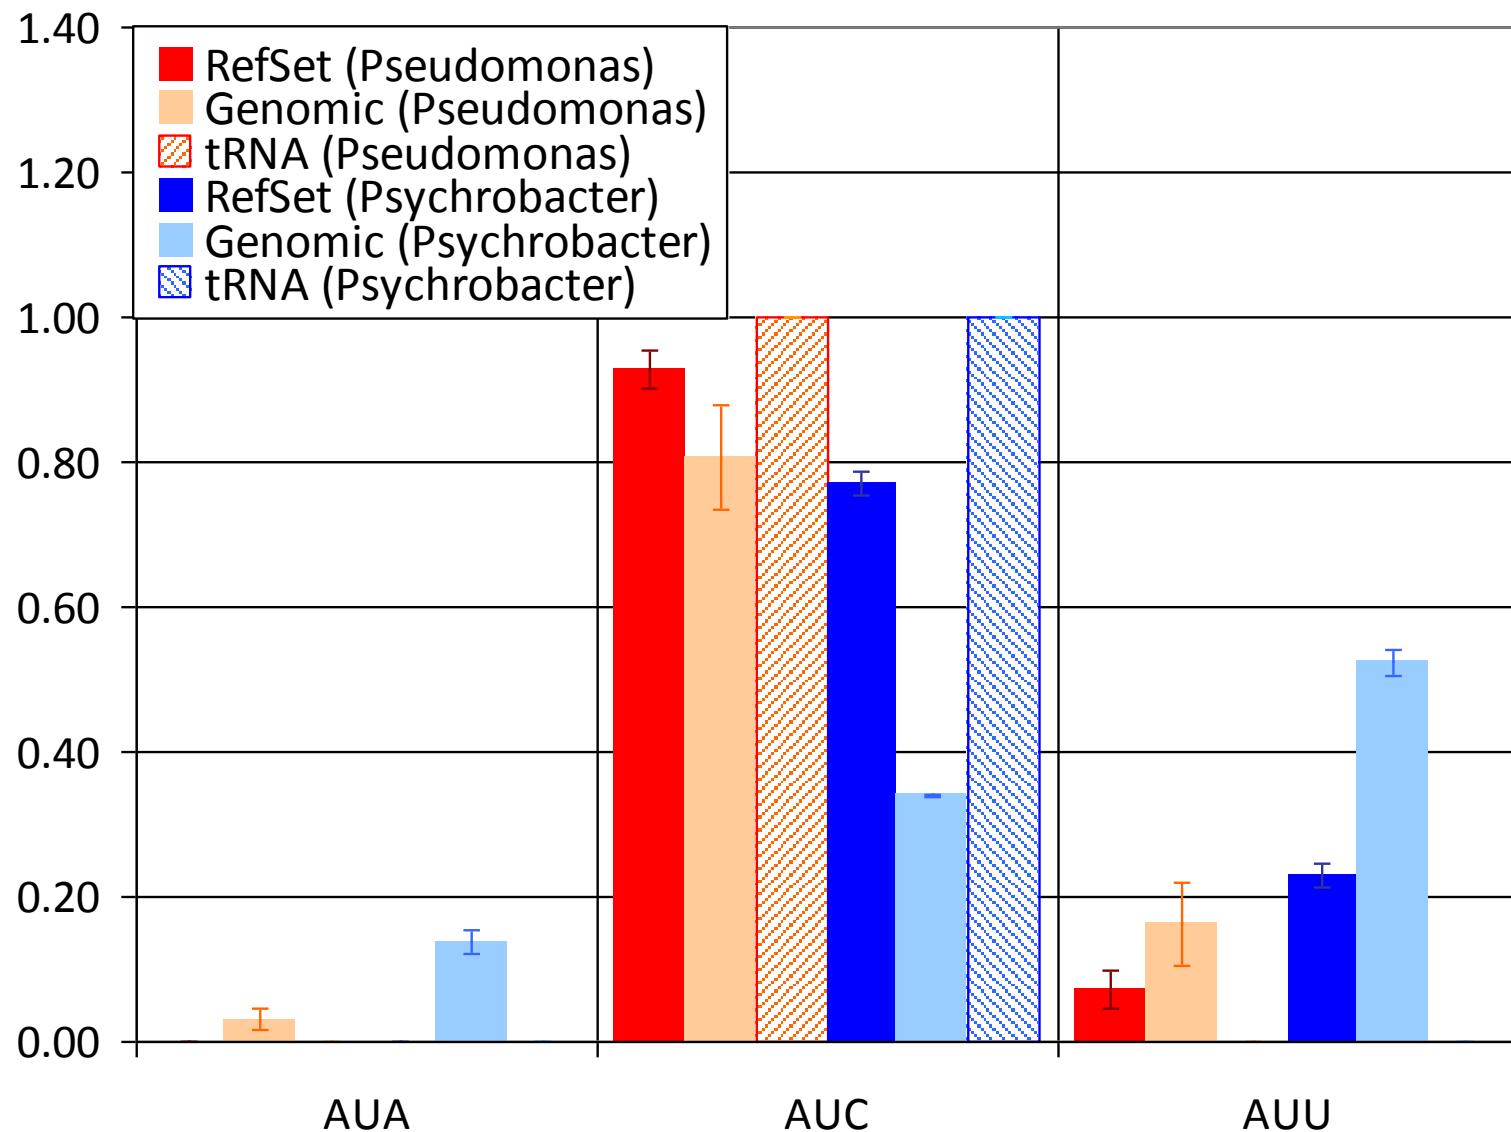

**Figure S1 – Word cloud of enriched annotation terms for the Pseudomonadales.**

The word cloud was generated by constructing a list of terms in which the count of each word is proportional to its enrichment ratio, using the wordle.net web service (<http://www.wordle.net/>). Notable is the predominance of terms associated with translational machinery; the heat-, cold- and oxidative-shock responses; and central carbon metabolism.

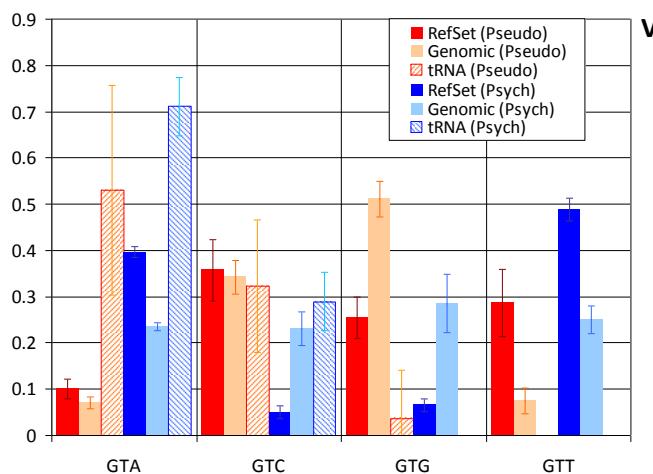

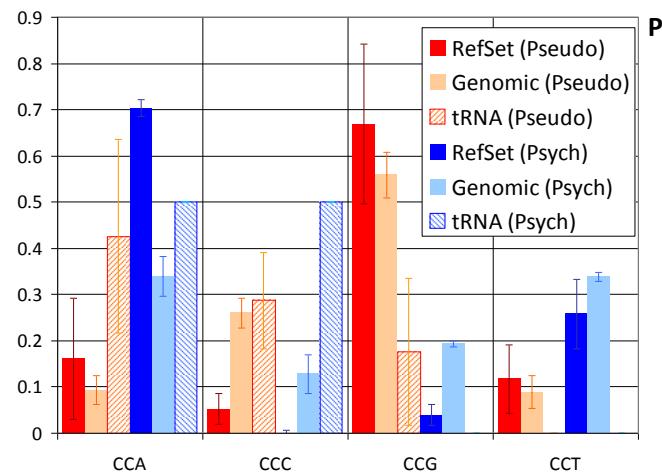

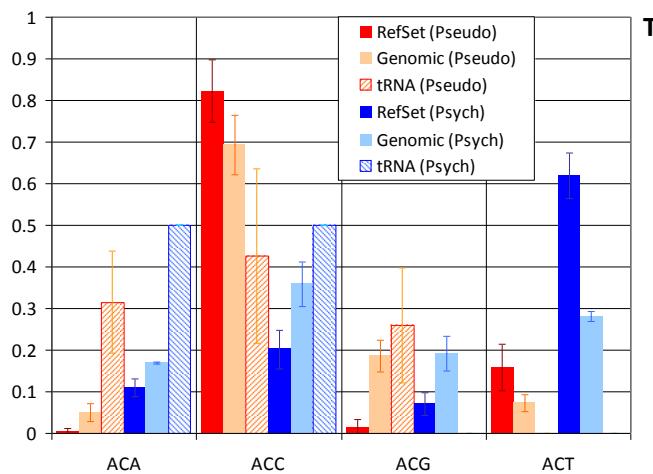

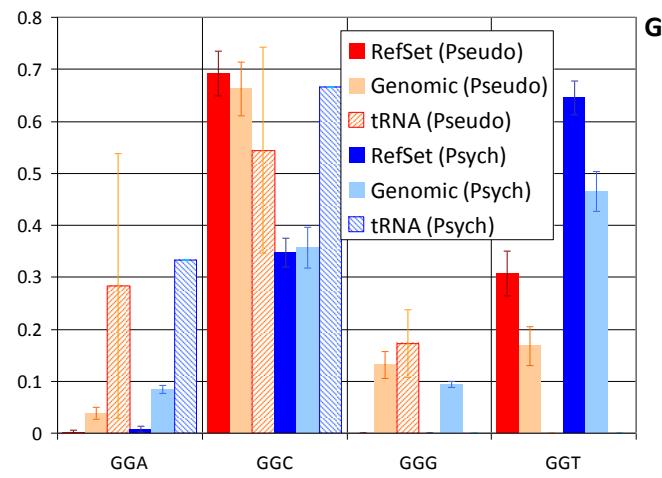

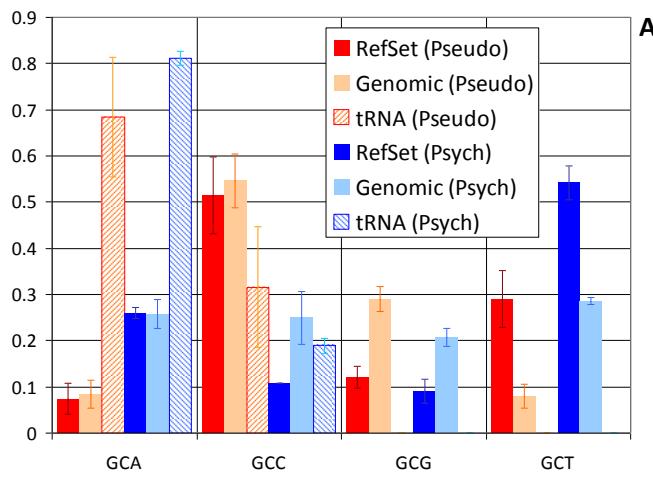

**Figure S2 – Codon and tRNA frequency distribution for two-box amino acids.**

Average two-box amino acid-normalized frequencies for codons in the reference set and in all protein-coding genes, and of gene copy number for the different ending cognate tRNAs. For each codon, the three leftmost series correspond to values for *Pseudomonas* species and the three rightmost to average values for *Psychrobacter* species. The respective amino acids are displayed on the top right. Vertical bars indicate the standard error of the mean.

**Figure S3 – Codon and tRNA frequency distribution for isoleucine.**

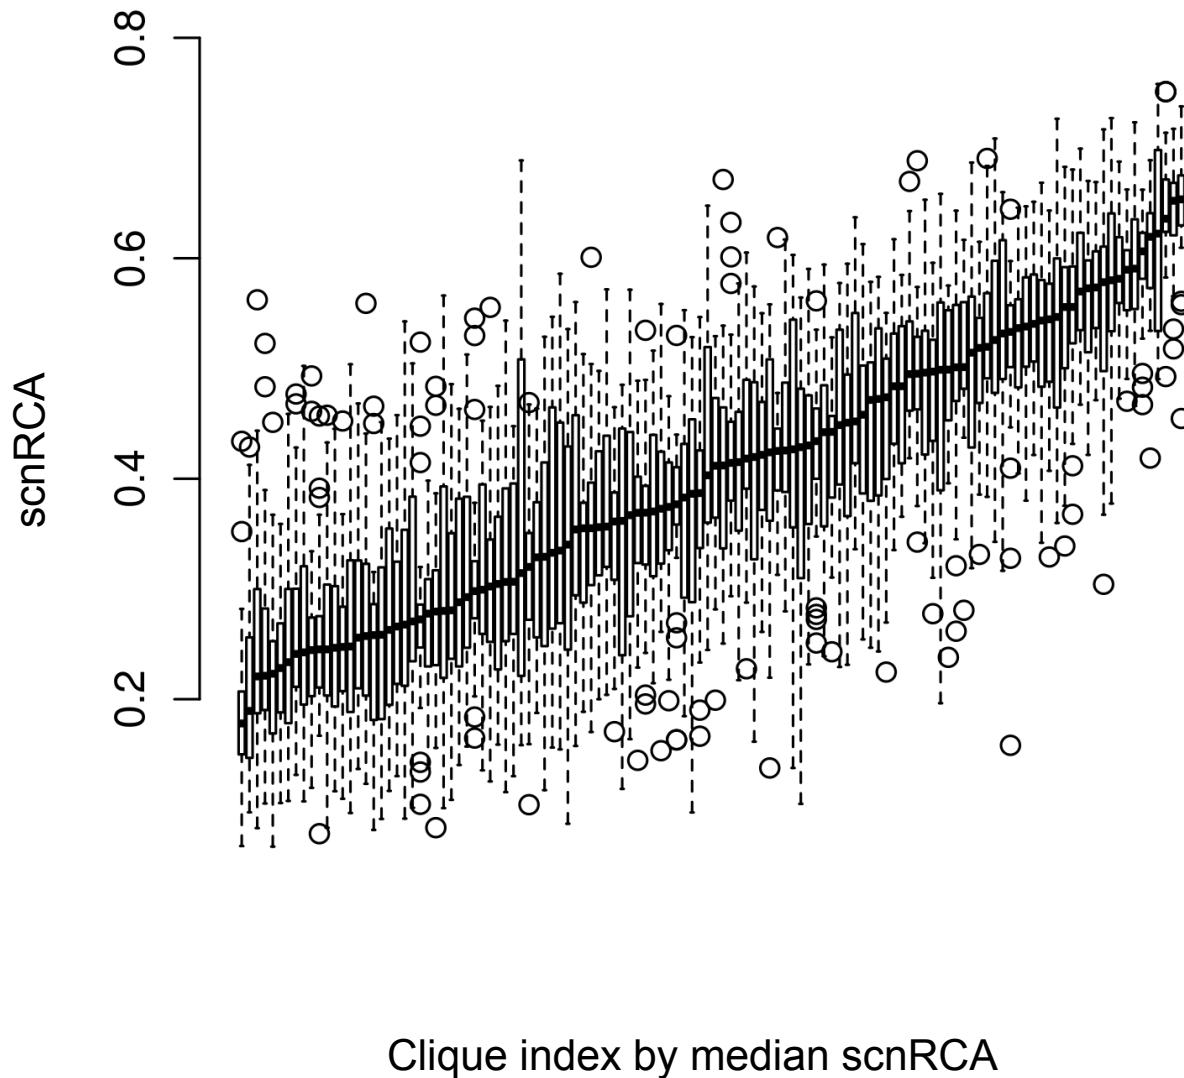

Average isoleucine-normalized frequencies for codons in the reference set and in all protein-coding genes, and of gene copy number for the different ending cognate tRNAs. For each codon, the three leftmost series correspond to values for *Pseudomonas* species and the three rightmost to average values for *Psychrobacter* species. Vertical bars indicate the standard error of the mean.

**Figure S4 – Codon and tRNA frequency distribution for four-box amino acids.**

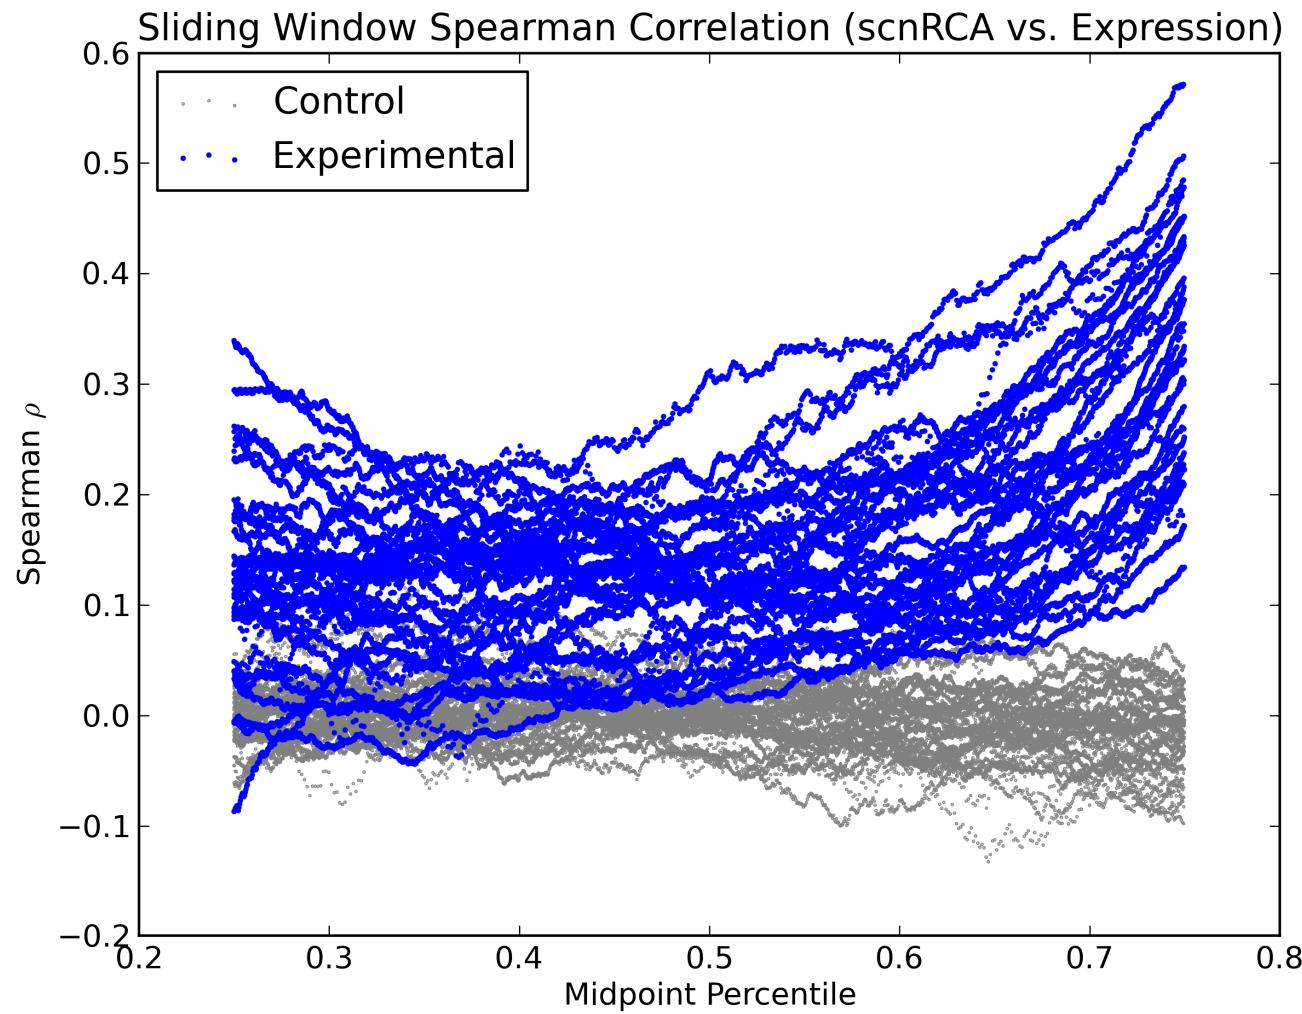

Average four-box amino acid-normalized frequencies for codons in the reference set and in all protein-coding genes, and of gene copy number for the different ending cognate tRNAs. For each codon, the three leftmost series correspond to values for *Pseudomonas* species and the three rightmost to average values for *Psychrobacter* species. The respective amino acids are displayed on the top right. Vertical bars indicate the standard error of the mean.

## scnRCA distributions in orthologous cliques

**Figure S5 – Distribution of scnRCA values for orthologous cliques.**

Distributions of scnRCA values for orthologous cliques shared between the full set of bacterial species analyzed in this work, sorted by median value.

**Figure S6 – Sliding-window analysis of correlation between scnRCA and expression levels.**

Plot of pair-wise inter-species Spearman correlations coefficients (Y-axis, blue) assessing the correlation between scnRCA values and expression levels in orthologous genes as a function of the position of the center of a sliding window (X-axis) spanning half the total number of pair-wise conserved homologs sorted by scnRCA value. The leftmost point on the X-axis corresponds to the window encompassing the lowest half of the scnRCA values among the orthologs between any two given species. The rightmost point on the X-axis corresponds to the window encompassing the highest half of the scnRCA values among the orthologs between any two given species. Correlation of scnRCA values with expression data was assessed on all 32 species for which expression data was available (Table S1). Window positions have been normalized to the total number of conserved homologs in each species pair to allow consistent overlaying. The p-values associated with each Spearman correlation are reported in Table S6. For each set of pair-wise homologs a randomized control of equal sample size is also shown (grey). The difference between the observed and control distributions of the Spearman  $\rho$  statistic are statistically significant across the whole range of scnRCA values. Results of Wilcoxon signed-rank tests against the paired randomized controls are reported in Table S7.

**Table S2 – Index correlation benchmark with expression data.**

Spearman correlation of scCAI, scRCA, MILC, CDC and Ran & Higgs'  $\delta$  with expression data for different bacterial species. The average and standard error of the Spearman correlation  $r_s$ , number of array samples (S#) and replicates (R#) and GEO accession number, are shown together with the ribosomal (Rib.), strength (Str.) and %GC3 content (Cont.) criteria for the scCAI and scnRCA methods, the number of annotated ribosomal proteins (RP#) used for the MILC method, and the genomic %GC content of each species. The ribosomal criterion (Rib.) is computed as the mean Z-score of scCAI/scnRCA values for ribosomal proteins against scCAI/scnRCA values for all protein-coding genes in the genome. The strength criterion (Str.) is computed as the mean Z-score of scCAI/scnRCA values for the isolated reference set against scCAI/scnRCA values for all protein-coding genes in the genome. The %GC3 content (Cont.) criterion is computed as the correlation between scCAI/scnRCA values and gene %GC3 content for all protein-coding genes in the genome (see Carbone *et al.* (2003) *Bioinformatics*, 19:16, 2005-2015).

| Species                                     | % GC | Method   | Average     | S#   | R# | Rib. | Str. | Cont. | RP# | GEO / Ref.               |
